4. Satellite simulator

# Quick Fire Emission Dataset (QFED)

- NRT estimates of biomass burning based on MODIS products
- Earlier version calibrated against GFEDv2 inventory using fire detections (hot spots) or fire radiative power (FRP)
- Newer version uses FRP and determines separate emissions per biome (possibly multiple biomes per grid box):

$$E_{\text{species}}(x,y,t) = \sum_{\text{biome}} C_{\text{biome,species}} \cdot \text{FRP}(x,y,t,\text{biome})$$

- Biomes from high resolution (~1 km) data set  
tropical forest, extratropical forest, savanna, grasslands
- Tuning is relative to older GFEDv2 calibrated emissions via suite of model runs, where AOT is decomposed by component and compared to MODIS AOT:

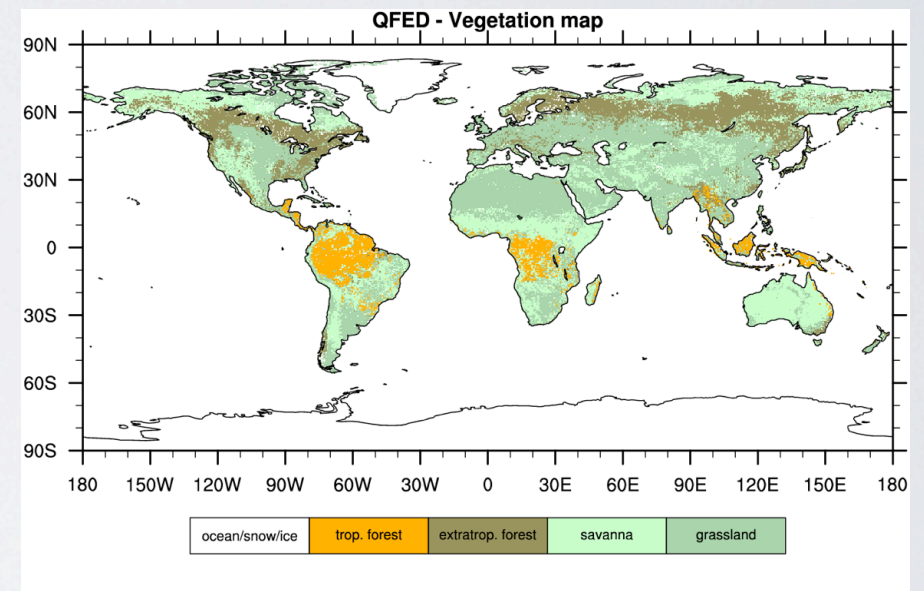

$$\tau_{\text{obs}} = \alpha_{\text{BB}} \tau_{\text{BB}} + \tau_{\text{dust}} + \tau_{\text{seasalt}} + \tau_{\text{anthro}} + \tau_{\text{etc}} + \dots$$

where

$$\alpha_{\text{BB}} \tau_{\text{BB}} = C_{\text{TF}} \tau_{\text{TF}} + C_{\text{XF}} \tau_{\text{XF}} + C_{\text{S}} \tau_{\text{S}} + C_{\text{G}} \tau_{\text{G}}$$

- Separate tuning for Aqua and Terra (redundancy)
- Final product is merged sensor 0.25° daily emissions of:

**BC, OC, SO<sub>2</sub>, CO, CO<sub>2</sub>, PM<sub>2.5</sub>**

Biome	C
Tropical Forest	2.5
xTropical Forest	4.5
Savanna	1.8
Grassland	1.8

Tuning relative to QFED I

# QFED Tuning

- QFEDv1 (and predecessor GFED) emissions led to anemic biomass burning AOT in model
- Simulations w/ and w/out specific biome biomass burning emissions used to tune QFED2
- Results are looked at systematically over ~ 40 regions
- Approach has greatly improved fidelity in regions where biomass burning is dominant over dust

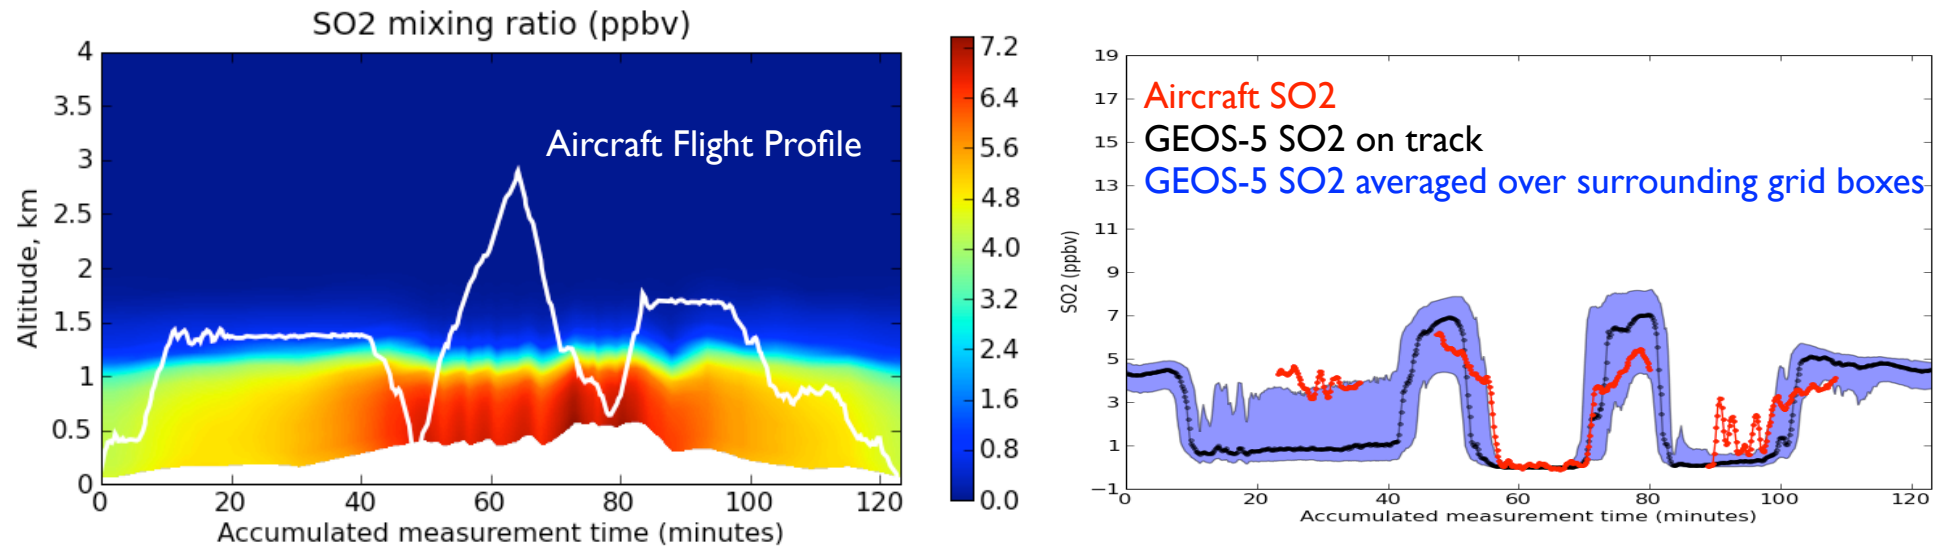

# Recent Developments

1. Improved NRT biomass burning emissions
- 2. Model evaluation**
3. Aerosol assimilation
4. Satellite simulator

# Impact of Model Resolution

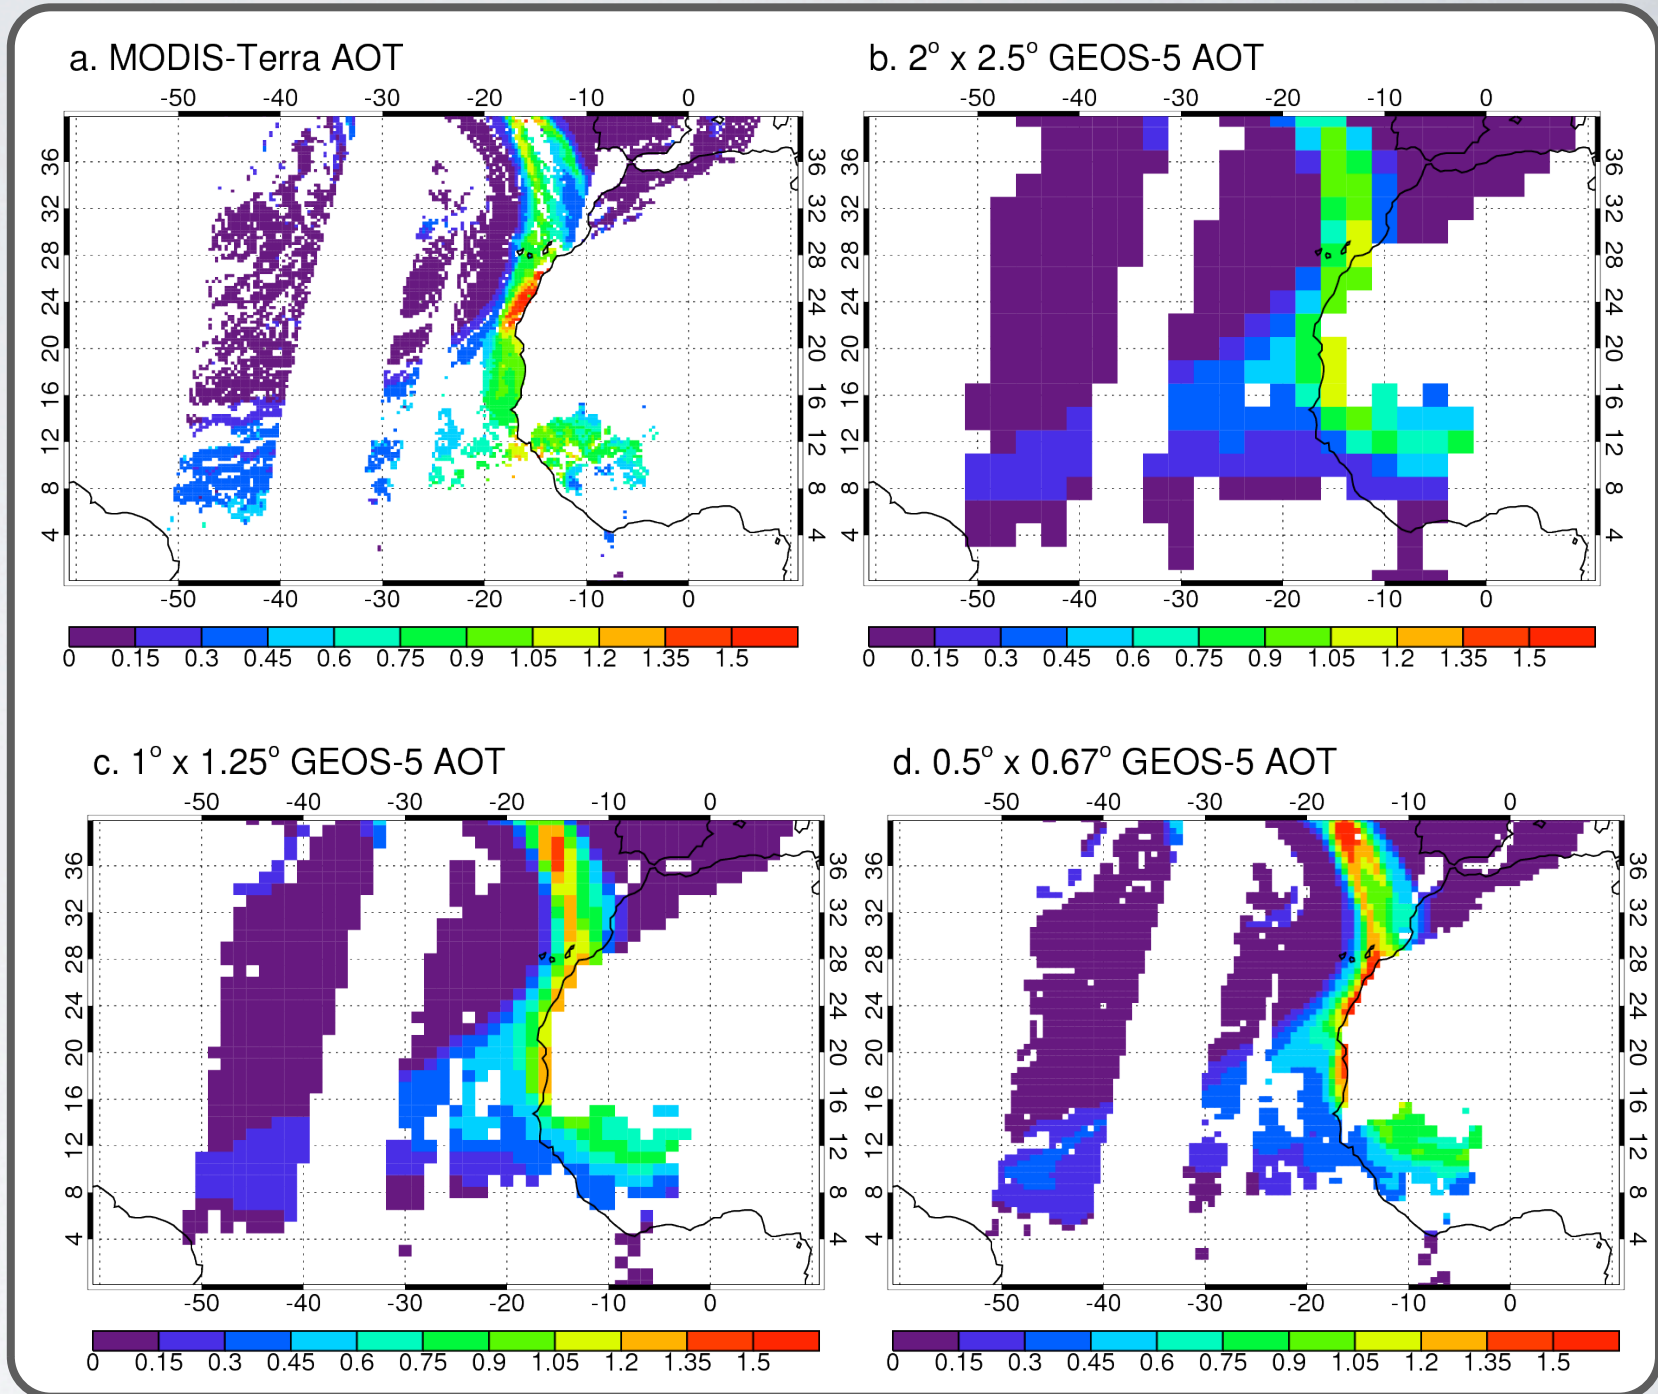

## 1. Global Dust Emissions

## 2. AOT Time Series at Capo Verde

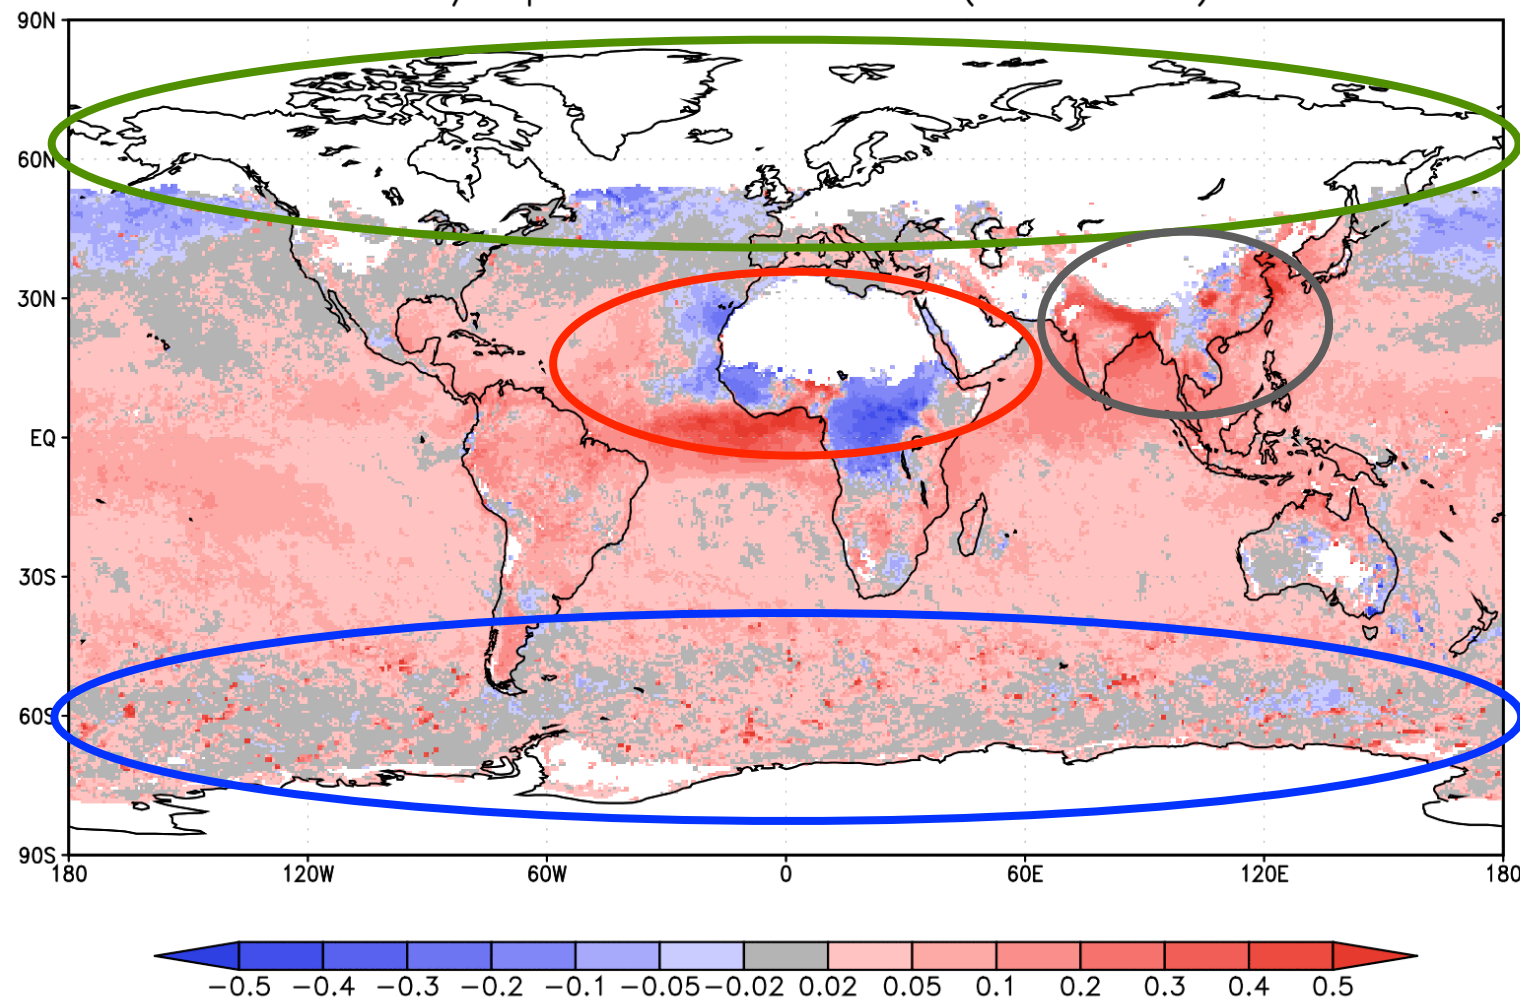

## 3. A Saharan Dust Event on 4/4/2008

- Computational costs dictate that most model tuning is done at coarse spatial resolution
- Operational systems run at higher spatial resolution

# Baseline Replay Simulation

NNR/Aqua - GEOS5 AOT (Jan 2007)

Model has

- High bias in African dust
- High bias in Southern Ocean
- High bias in autumn NH AOT; somewhat low bias in spring
- Low bias in Asian anthropogenic

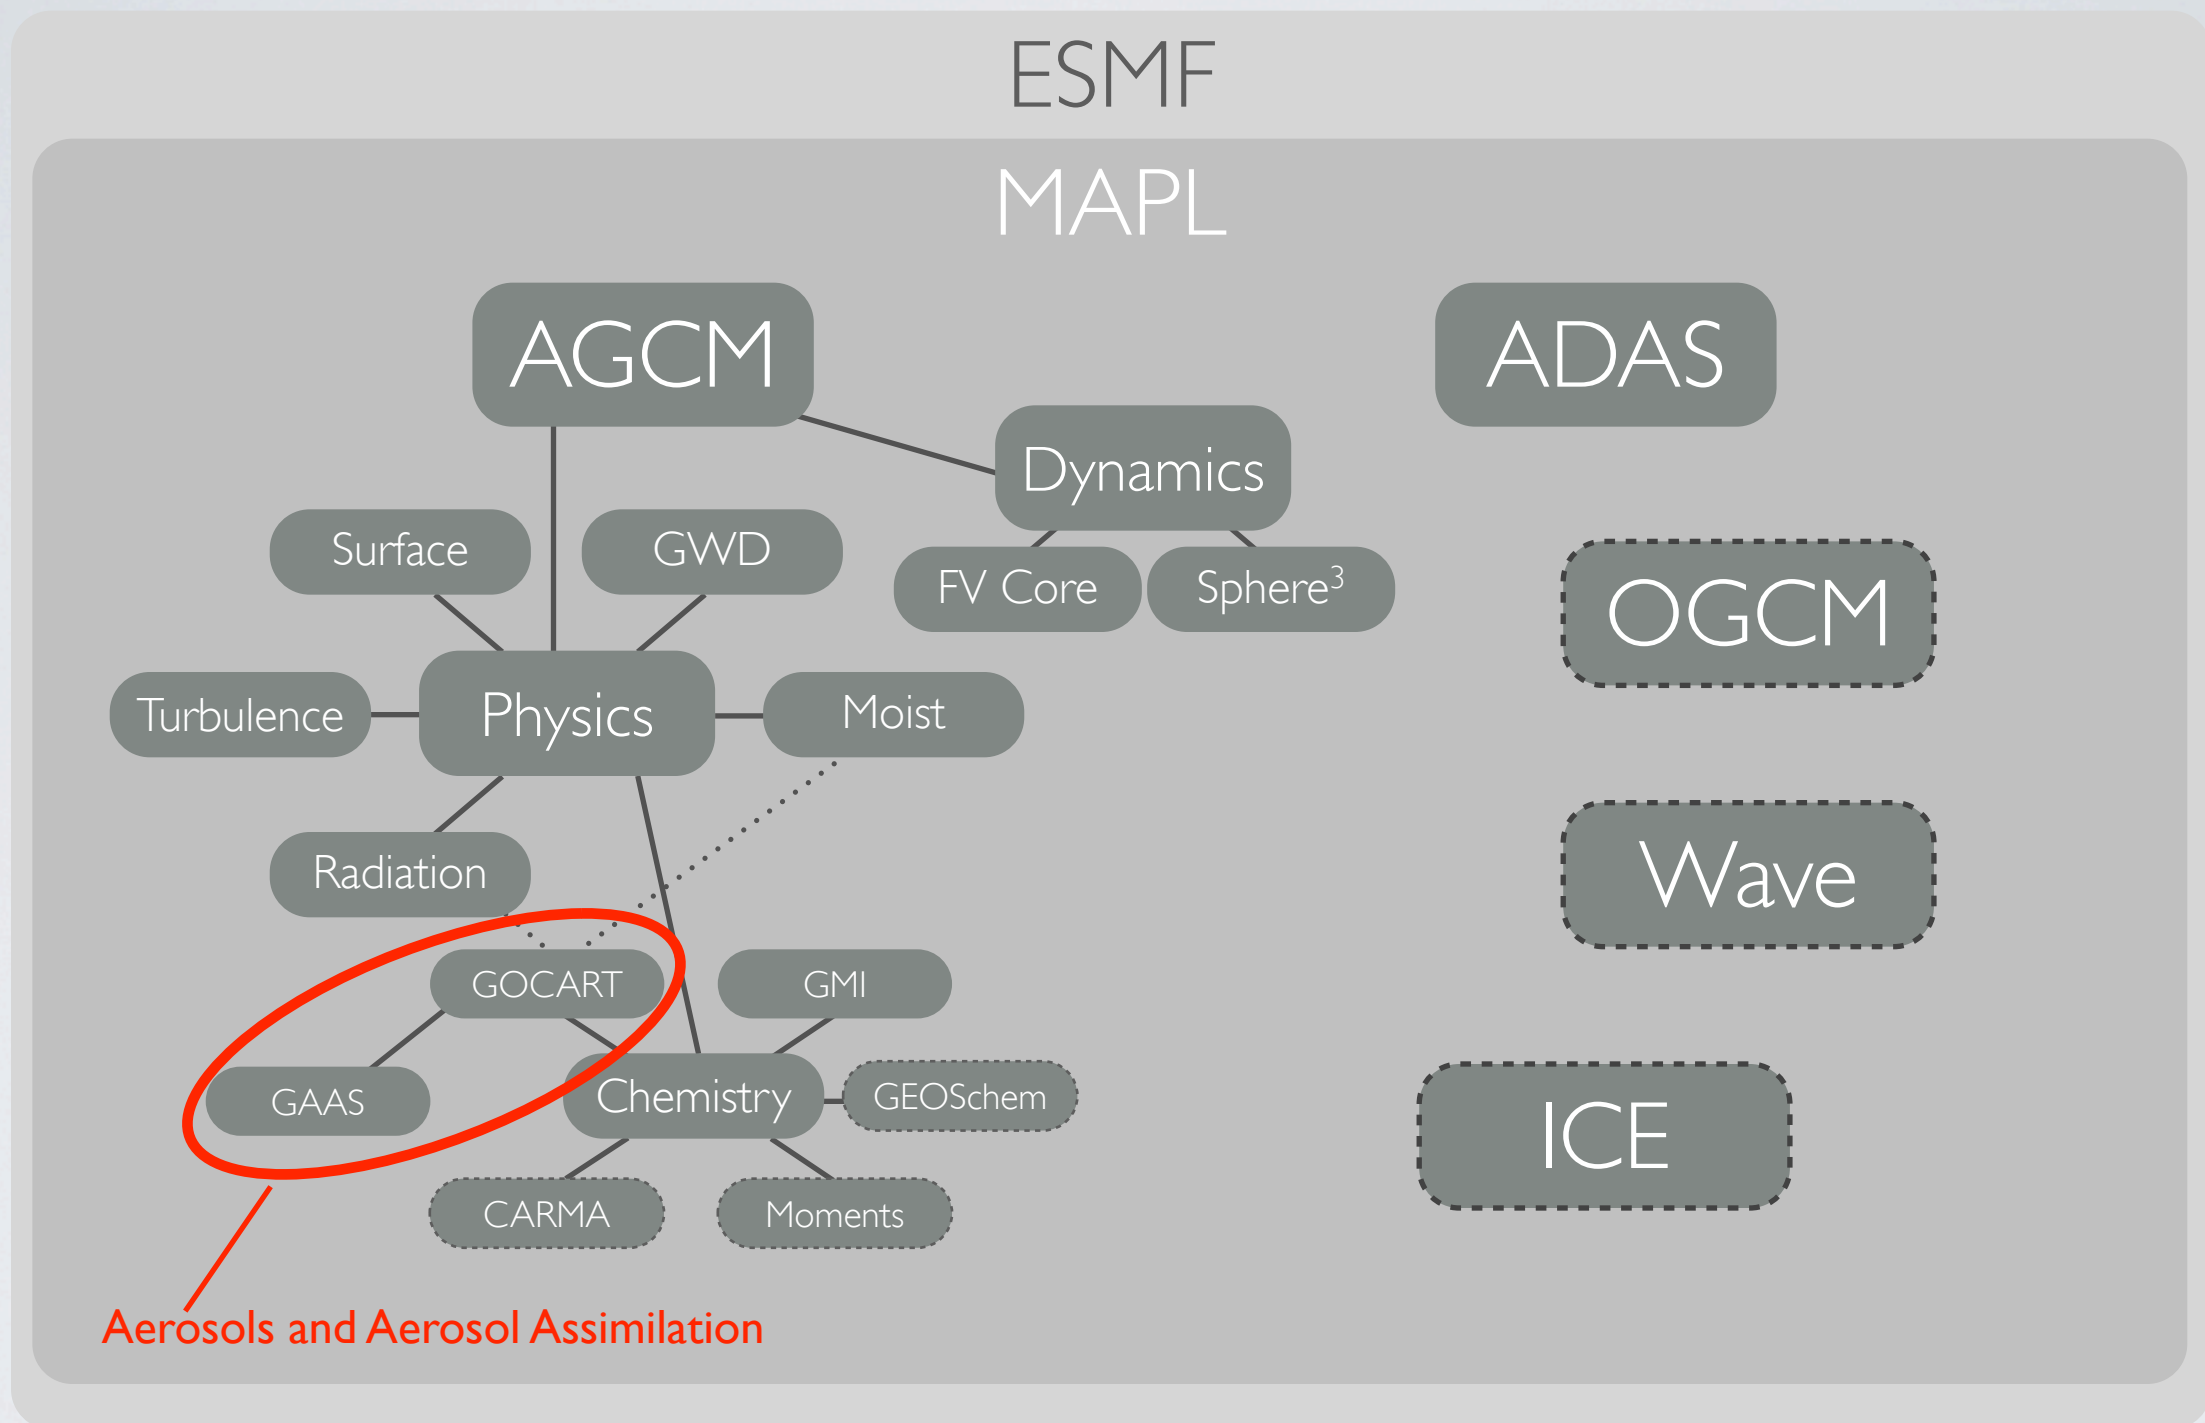

- Global  $0.5^\circ \times 0.625^\circ$  replay from MERRA analyses
- QFED2 biomass burning emissions
- EDGAR4.1  $\text{SO}_2$  anthropogenic emissions
- Other inventory emissions from AeroCom

# Recent Developments

1. Improved NRT biomass burning emissions
2. Model evaluation
- 3. Aerosol assimilation**
4. Satellite simulator

# GEOS-5 Structure

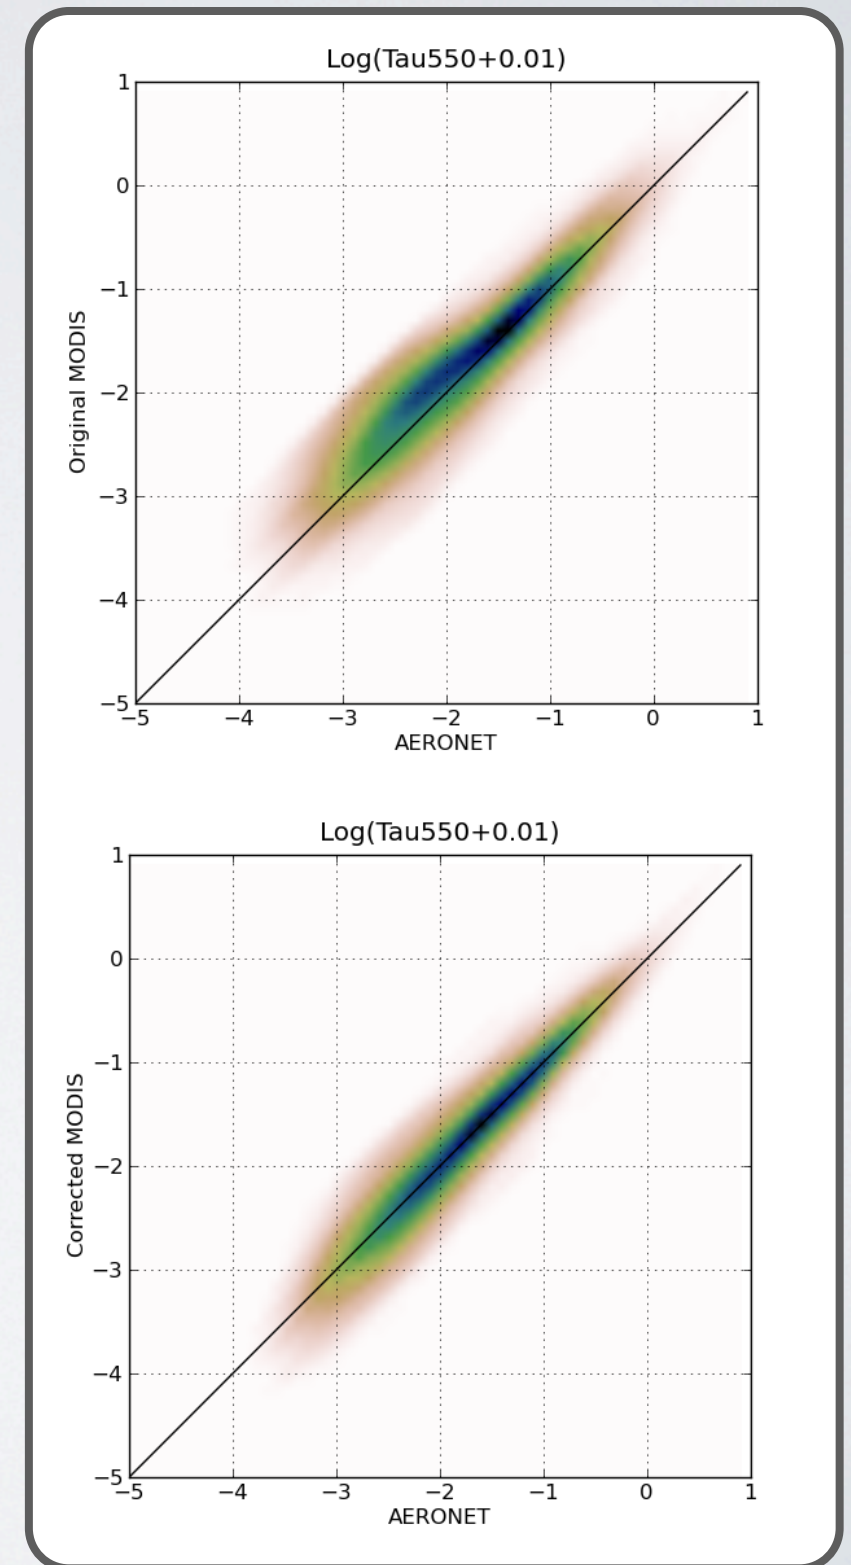

# Quality Control MODIS AOT

- MODIS AOT product has errors and biases
- A new AOT is developed by training a neural net based retrieval (NNR)
- Predictors are (at MODIS L2 retrieval points):
  - MODIS TOA radiances
  - Viewing geometry
  - Glint angle (ocean)
  - Cloud fraction
  - Wind speed (ocean)
  - Surface albedo (land, climatological)
- Target is historical co-located AERONET record of AOT (log-transformed to normalize statistics)
- Product is 8 x day, 0.25° 550 nm AOT (Aqua/Terra, Land/Ocean)

**Right:** Joint PDF comparison of original MODIS AOT to co-located AERONET (top) and result of NNR (bottom). Results for MODIS Terra over ocean; similar comparisons made for other.

# Assimilation Methodology

- GEOS-5 Aerosol Assimilation System (GAAS) assimilates AOT from MODIS (land/ocean, Terra/Aqua)
  - Other sensors (e.g., MISR for hindcast) in development
- Simultaneous estimates of background bias (Dee and da Silva, 1998)
- Adaptive statistical quality (Dee et al., 1999)
  - State dependent, adapts to error of the day
  - Background and buddy check based on log-transformed AOD
- Error covariance models (Dee and da Silva, 1999)
  - Innovation based
  - Maximum likelihood
- Lagrangian displacement ensemble technique captures, e.g., plume misplacements

- 4. Satellite simulator**

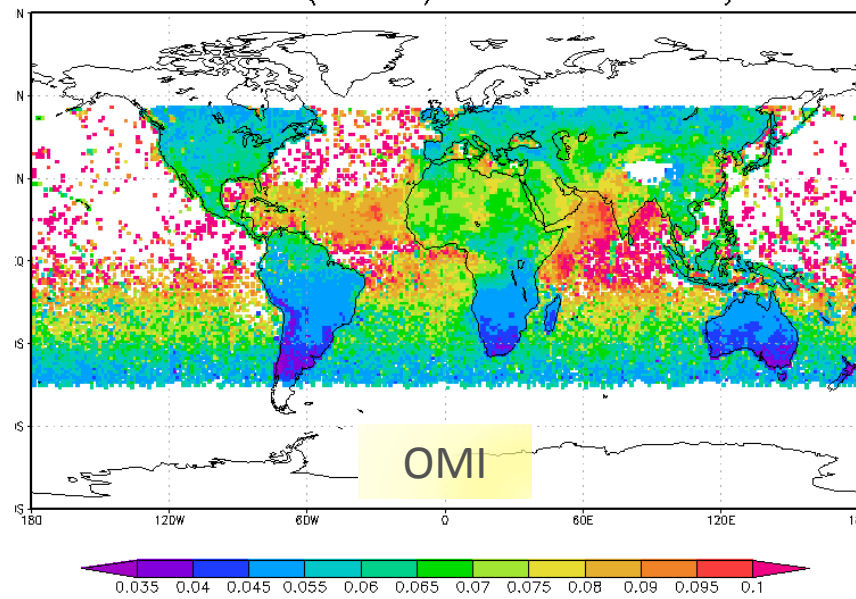

# VLIDORT Simulations

- GEOS-5 simulates aerosol mass
- Optical properties ( $\tau$ ,  $\omega_0$ ,  $P(\Theta)$ ) from pre-computed size/composition/humidity dependent LUT
- VLIDORT vector radiative transfer code (Rob Spurr) takes input profile of model optical properties at OMI locations/view geometry
- Spectral TOA radiances computed for direct comparison to OMI
  - Surface albedo (Lambertian) from TOMS UV climatology
  - No clouds in calculation (for now)
  - Aerosol Index (AI) computed from 354 nm and 388 nm radiances

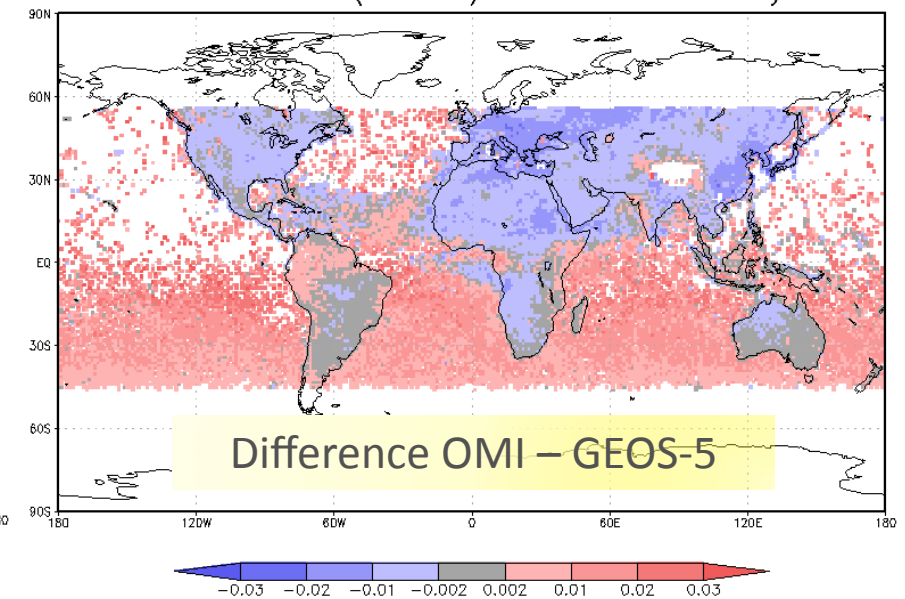

GEOS-5 – radiances (388 nm) – June 2008 Monthly Mean

OMI – radiances (388 nm) – June 2008 Monthly Mean

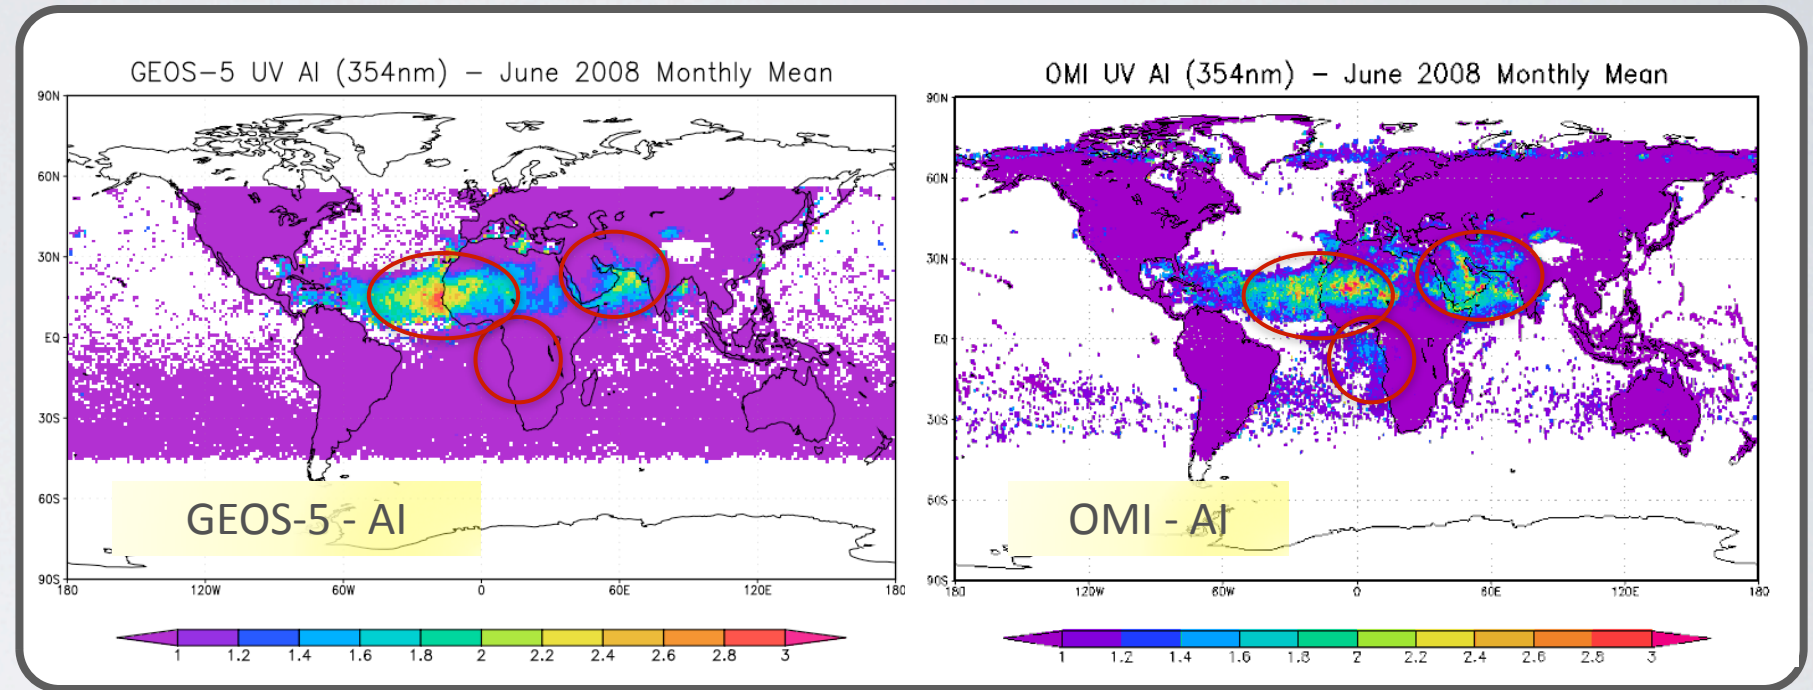

OMI – GEOS-5 rad (388 nm) – June 2008 Monthly Mean

Optical Depth

# Future Directions

- Completion of high resolution baseline run through 2010
- Evaluation of baseline run
- Replay with assimilation of aerosols; evaluation
- GMAO: Plan is to run assimilation operationally June 1
- How does this contribute to ICAP?
