

# Development and Evaluation of Global and Regional emissions for Atmospheric Modeling and Forecasting

**Claire GRANIER**

University Pierre and Marie Curie/CNRS, Paris, France  
NOAA Earth System Res. Lab, Boulder, CO, USA  
Max-Planck Institute for Meteorology, Hamburg, Germany

**Hugo Denier van der Gon**  
TNO, Utrecht, The Netherlands

## **Questions (and **Answers?**): Global Emissions**

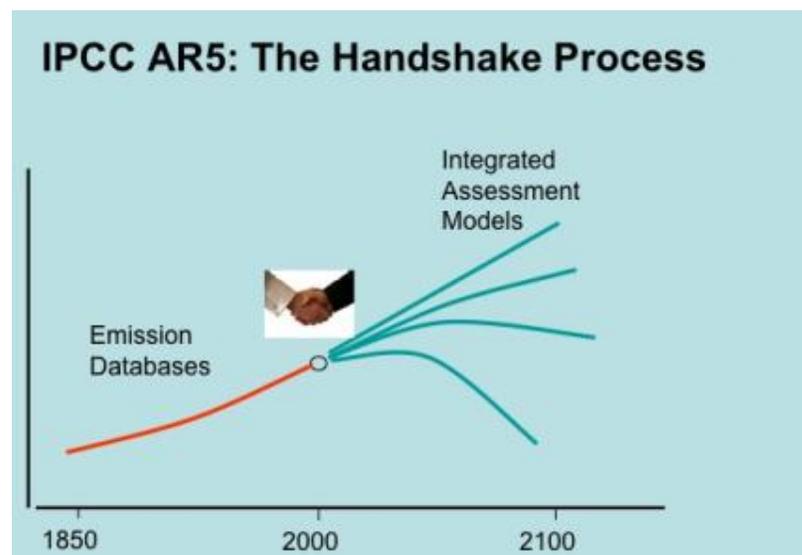

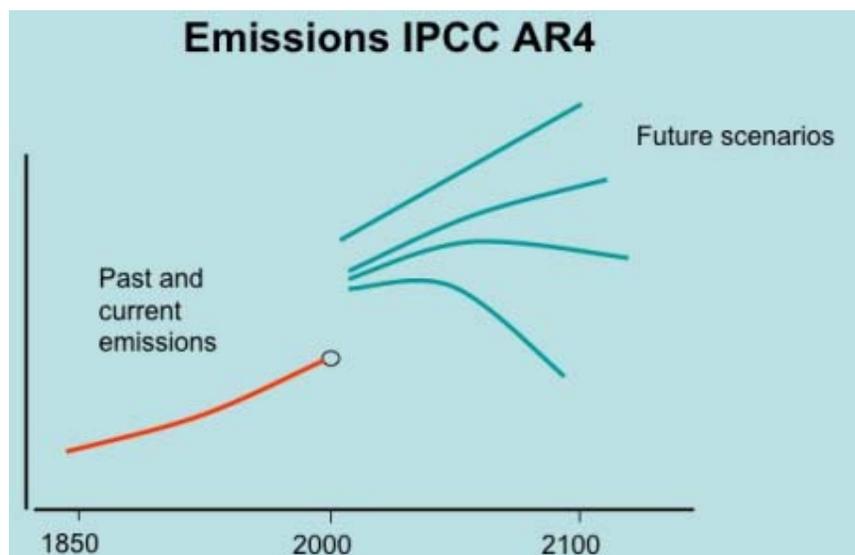

- 1. Do we have consistent historical emissions?**
  - 2. Can we trust current datasets/can we recommend a “best” dataset?**
  - 3. Can we compare emissions by sectors?**
  - 4. What about anthropogenic VOCs?**
- + Where can you find many of the datasets used here**

**Followed by: Regional Emissions (Hugo)**

# 1. Do we have consistent historical emissions?

## The ACCMIP dataset

ACCMIP = Atmospheric Chemistry and Climate Model Intercomparison Project  
Simulations in support to the the IPCC 5<sup>th</sup> Assessment report (2013)

- Consistency between past/current/future
- Dataset with documentation and references

More details: Lamarque et al., ACP 2010 ; van Vuuren et al., Clim. Change, 2011  
Granier et al., Climatic Change, 2011; Lamarque et al, Climatic Change, 2011

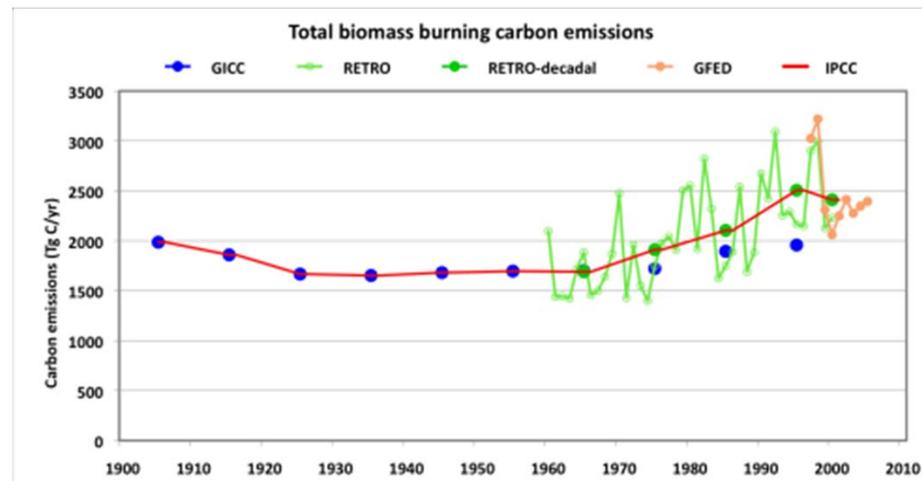

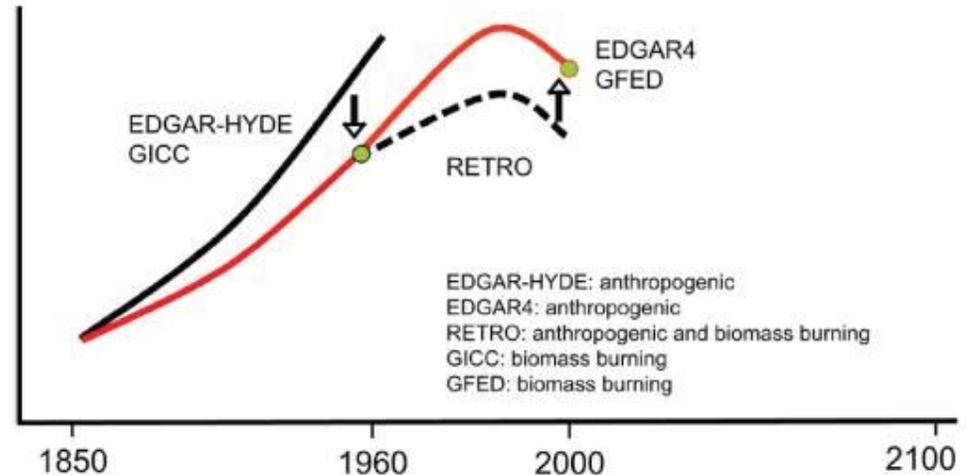

# ACCMIP = Consistent long-term emissions dataset

Developed in 2008-2009 by  
an international group

ACCMIP emissions dataset:

- Anthropogenic and biomass burning emissions
- Period covered: 1850 – 2000
- Available for each decade
- no seasonal variation
- 0.5x0.5 degree

Large set of species:  
CH<sub>4</sub>, CO, NO<sub>x</sub>, SO<sub>2</sub>, NH<sub>3</sub>  
Many VOCs  
BC and OC

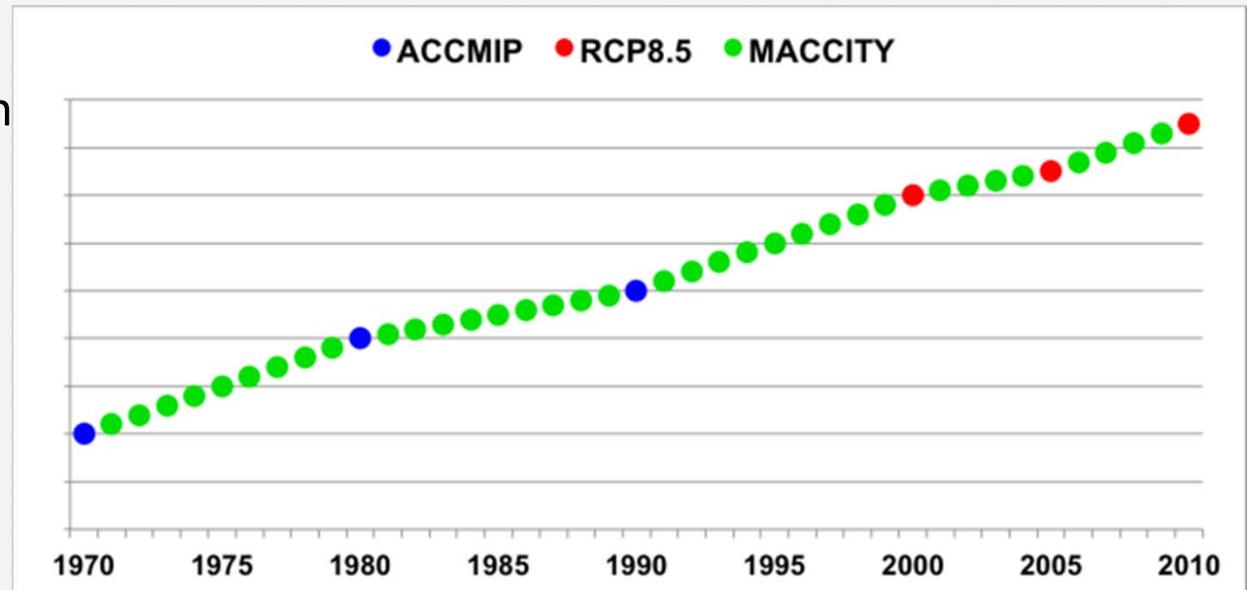

# Global MACCity emissions inventory

(Developed as part of EU projects: MACC and CityZen + PEGASOS)

- 1960-2000: ACCMIP (described in Lamarque et al., 2010), decadal
- After 2000, no global emissions dataset available
- **(Emissions Update: common issue specially for global emissions)**  
→ Use of one of the IPCC future scenarios (**RCP 8.5**) for 2005 and 2010 that uses some regional information for Europe, N. America & Asia

## MACCity anthropogenic emissions:

- Linear interpolation for of ACCMIP an emissions
- Implementation of seasonal emissions from the RETRO emissions (Schultz et al., 2007)

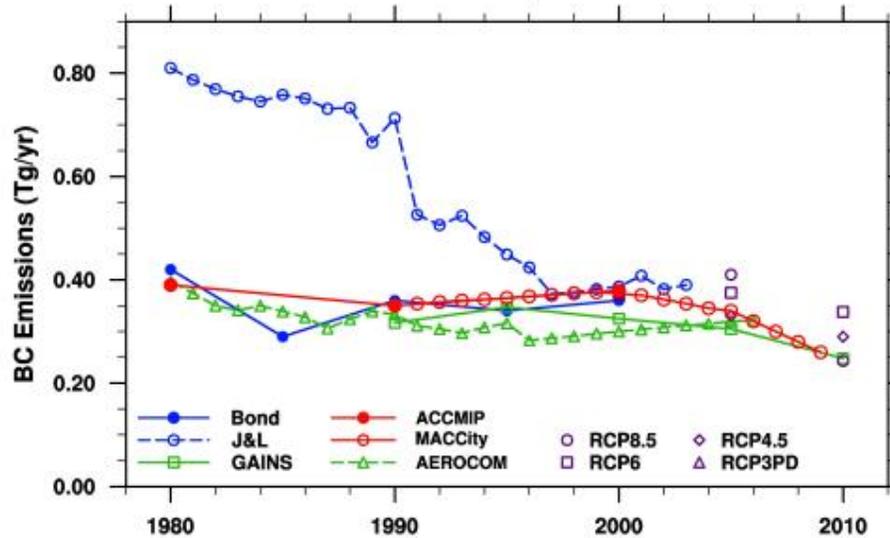

*More information on MACCity in Granier et al., Climatic Change, 2011*

## **2. Can we trust current datasets/can we recommend a “best” dataset**

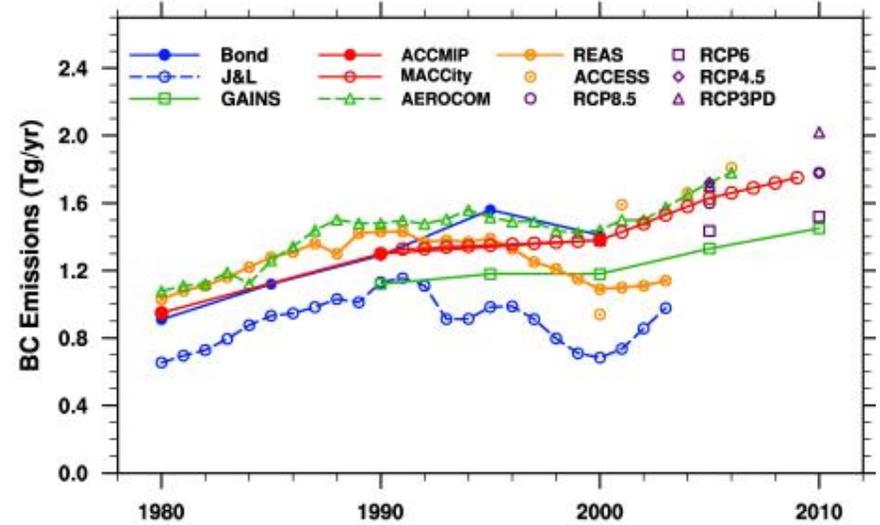

- Perform systematic evaluations of publicly available surface emissions**
- Open to all people willing to propose new data / analyze results**
- Start with the 1980-2010 period**
- Only publicly available gridded inventories considered so far**
- Focus on: CO, NO<sub>x</sub>, SO<sub>2</sub> and BC (under way: CH<sub>4</sub>, OC, total NMVOCs and NH<sub>3</sub>)**
- Focus on total emissions, start to look at spatial distribution**

# More details: Granier et al., 2011(26 authors)

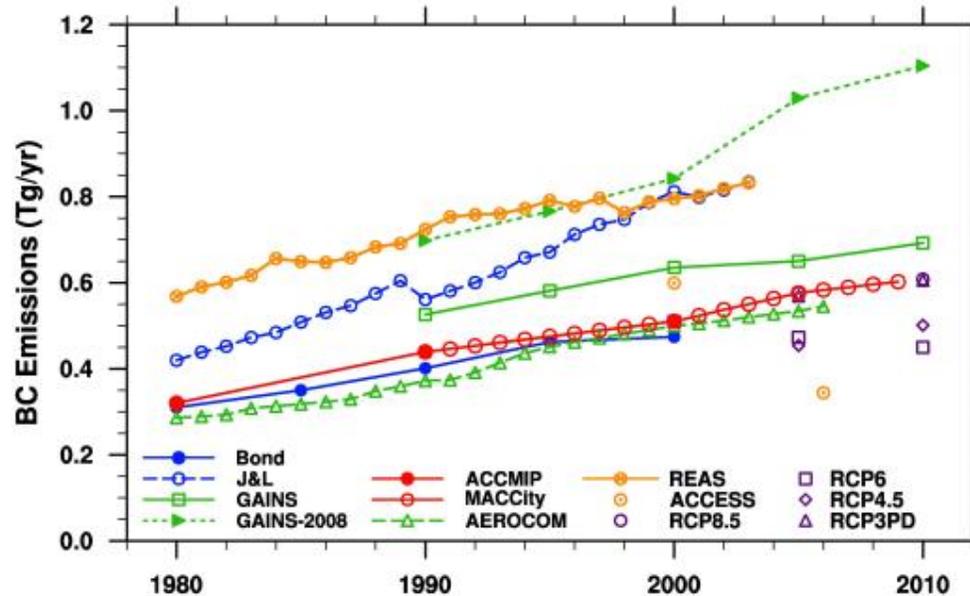

BC Western Europe emissions

BC China emissions

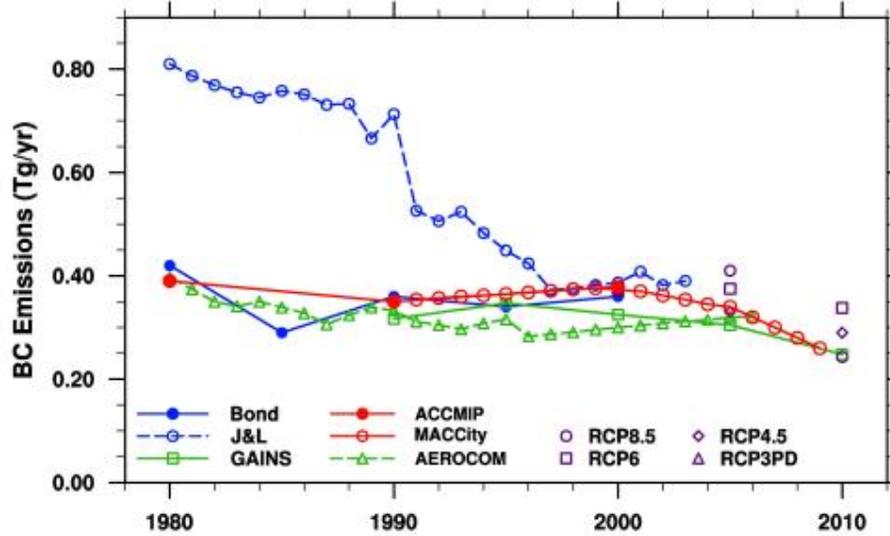

BC India emissions

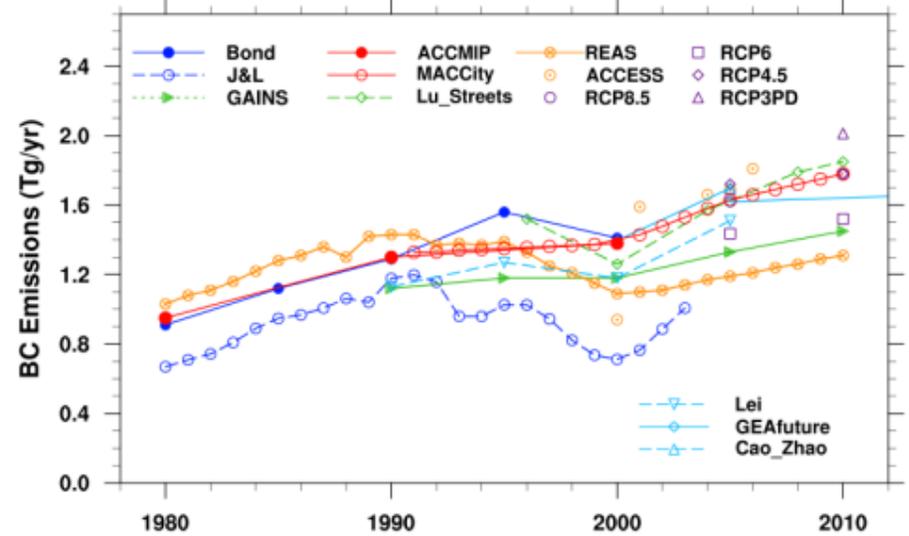

# With more recent inventories

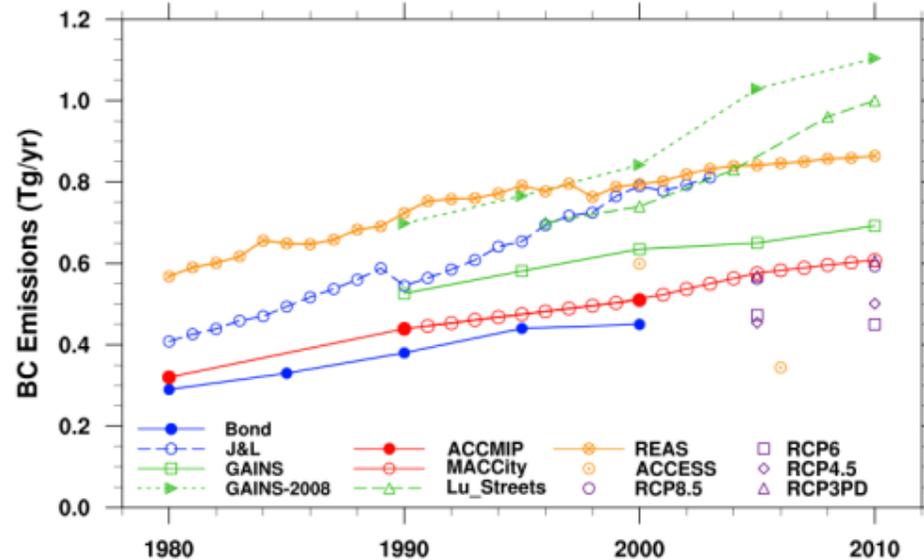

BC Western Europe emissions

BC China emissions

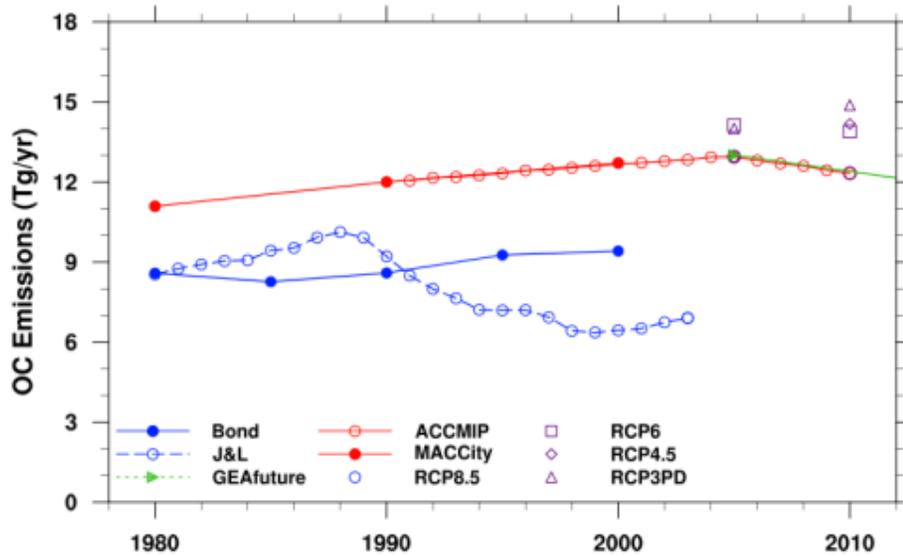

BC India emissions

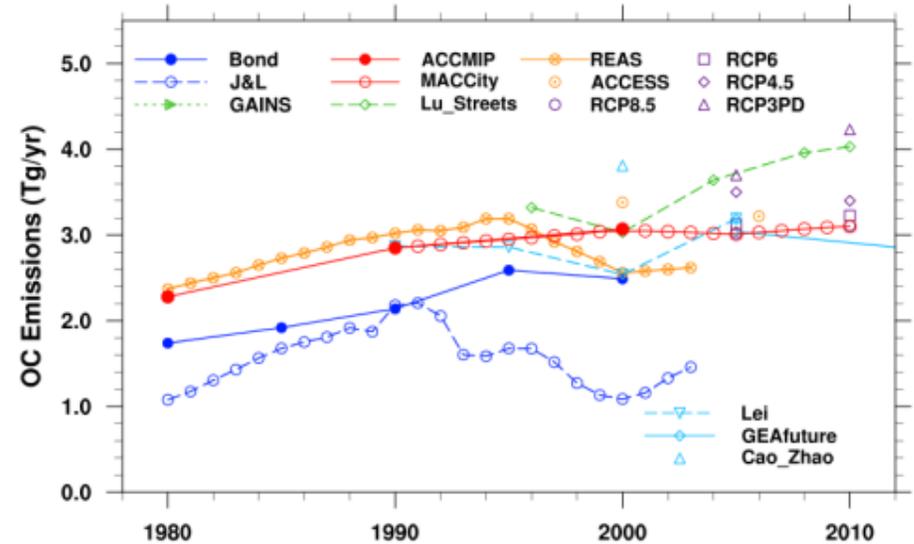

# OC emissions (work under way)

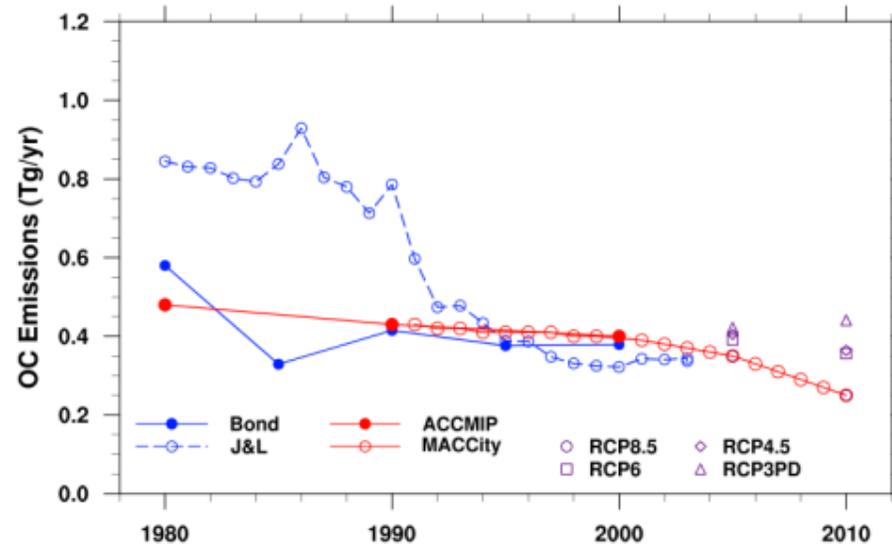

OC Total emissions

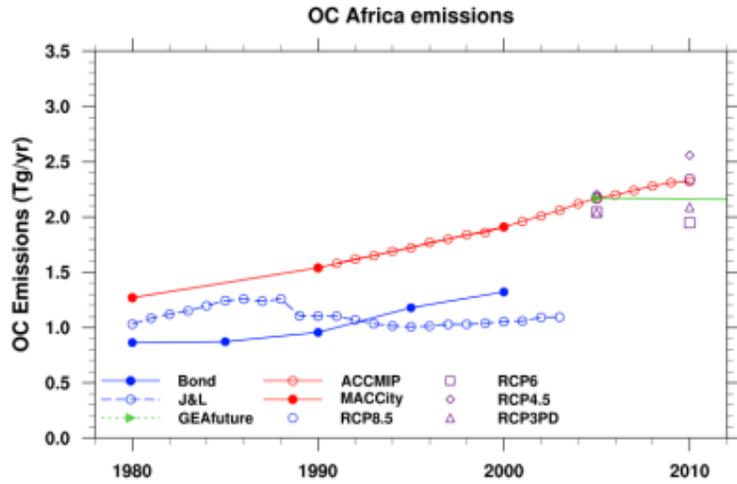

OC China emissions

OC Western Europe emissions

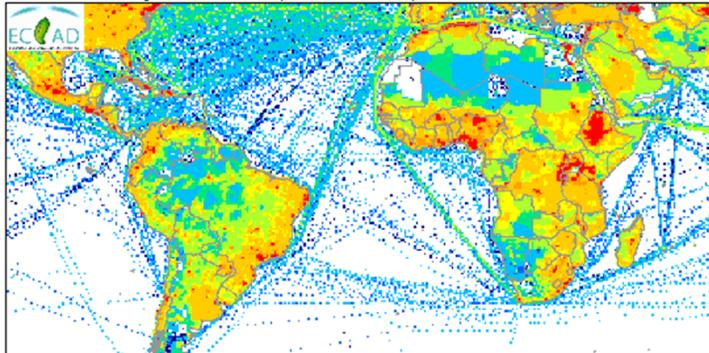

# More OC comparisons

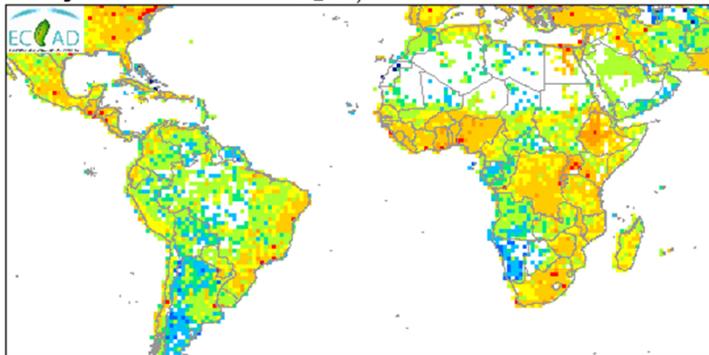

OC Emissions from Africa + South America = 29% of total

Based on a few new observations from C. Liousse's group

MACCity: anthro\_OC, Sum sector, 2000-03

Junker-Liousse: anthro\_OC, 2000

# NH3 emissions (work under way)

# Summary: ratio between highest and lowest emissions

		1980	1990	2000	2005
<b>BC</b>	Total	1.53	1.61	1.27	1.27
	Western Europe	2.08	2.04	1.29	1.28
	Central Europe	2.45	2.81	2.21	1.40
	USA	2.38	2.77	1.61	1.59
	China	1.64	1.31	2.12	1.29
	<b>CO</b>	Total	1.27	1.33	1.28
	Western Europe	1.34	1.55	1.77	1.30
	Central Europe	1.43	2.11	1.76	2.10
	USA	1.87	1.73	1.86	1.83
	China	1.34	1.54	1.43	1.17
<b>NO<sub>x</sub></b>	Total	1.10	1.25	1.23	1.19
	Western Europe	1.14	1.18	1.20	1.18
	Central Europe	1.32	1.41	1.24	1.25
	USA	1.27	1.41	1.19	1.43
	China	1.91	1.66	1.31	1.42
	<b>SO<sub>2</sub></b>	Total	1.19	1.28	1.54
Western Europe		1.25	1.49	2.35	2.35
Central Europe		2.04	1.37	2.08	2.71
USA		1.23	1.26	1.20	1.47
China		1.45	1.66	1.87	1.68

**Green:**  
1 to 1.25

**Yellow:**  
1.25 to 1.5

**Orange:**  
1.5 to 1.75

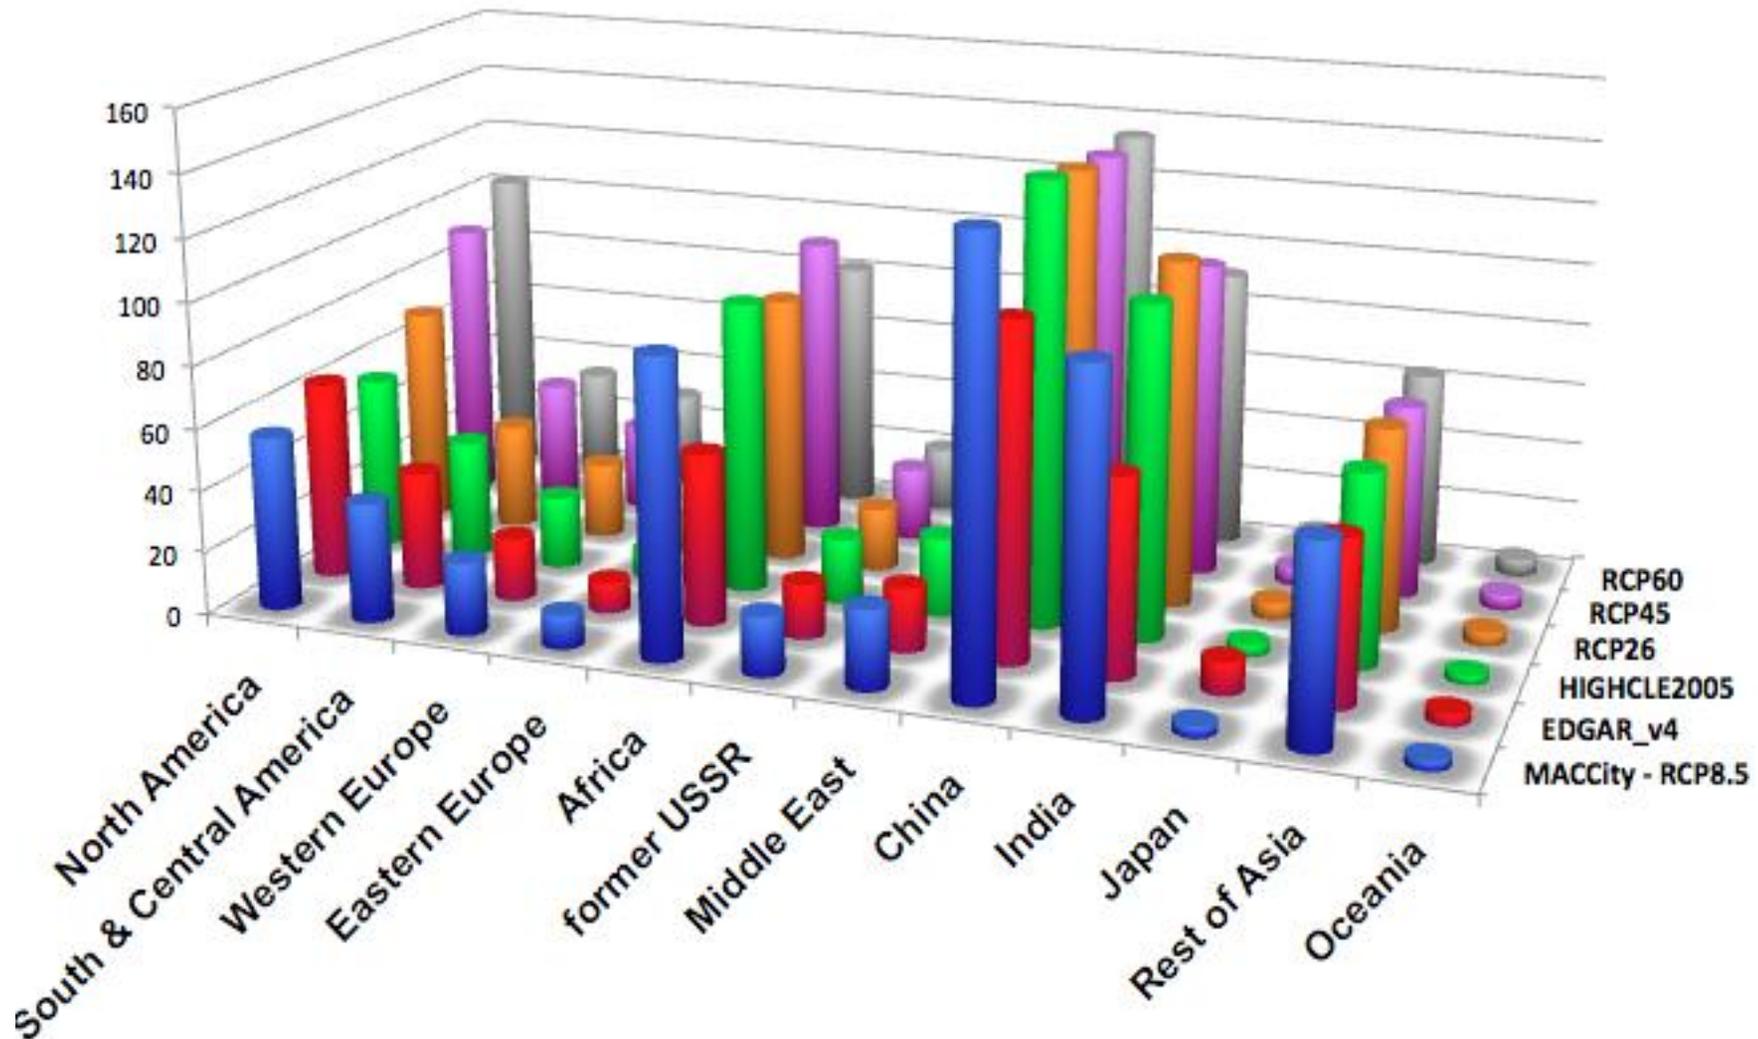

**Grey:**  
Above 1.75

**BUT: consensus ≠ accuracy**

# CO emissions from other global datasets for 2005

→ Inclusion of EDGAR-v42 (no BC and OC yet provided)

■ MACCity - RCP8.5 ■ EDGAR\_v4 ■ HIGHCLE2005 ■ RCP26 ■ RCP45 ■ RCP60

### 3. Can we compare emissions by sectors?

Answer: not easily, since no common sectors description

#### Climate community:

Sector number	Sector name
1	Energy production and distribution
2	Industry (combustion and non-combustion)
3	Land transport
4	Maritime transport
5	Aviation
6	Residential and commercial
7	Solvents
8	Agriculture
9	Agricultural waste burning on fields
10	Waste
11	Open vegetation fires in forests
12	Open vegetation fires in savanna and grasslands
13	Natural emissions

#### European air quality community:

SNAP	Description
1	Public electricity and other energy transformation
2	Small combustion plants
3	Industrial combustion and processes with contact
4	Industrial process emission
5	Fossil fuel production
6	Solvent and product use
7	Road Transport
8	Other (non-road) transport and mobile machinery
9	Waste disposal
10	Agriculture
11*	Nature

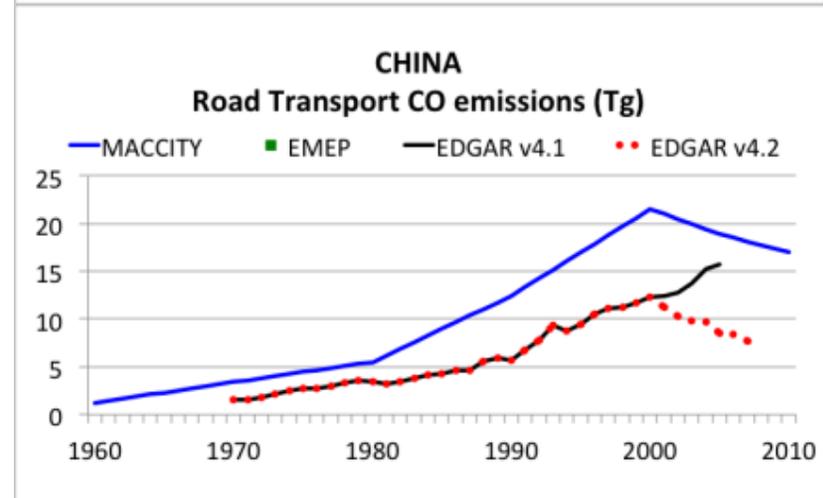

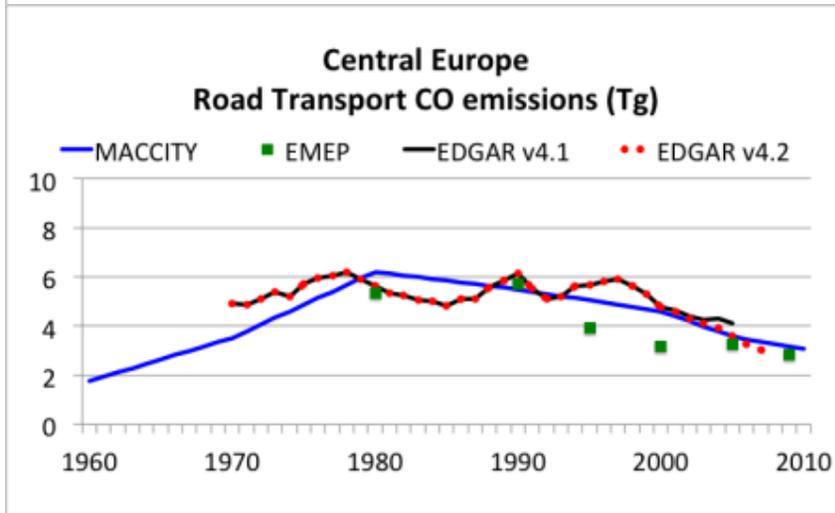

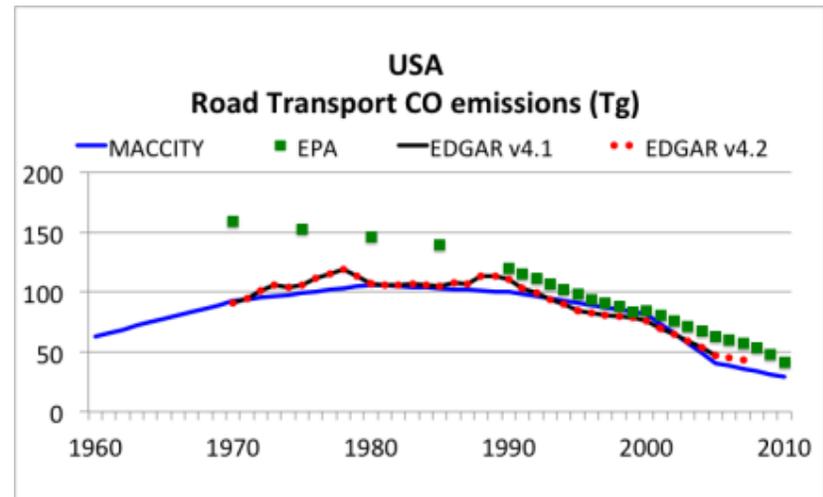

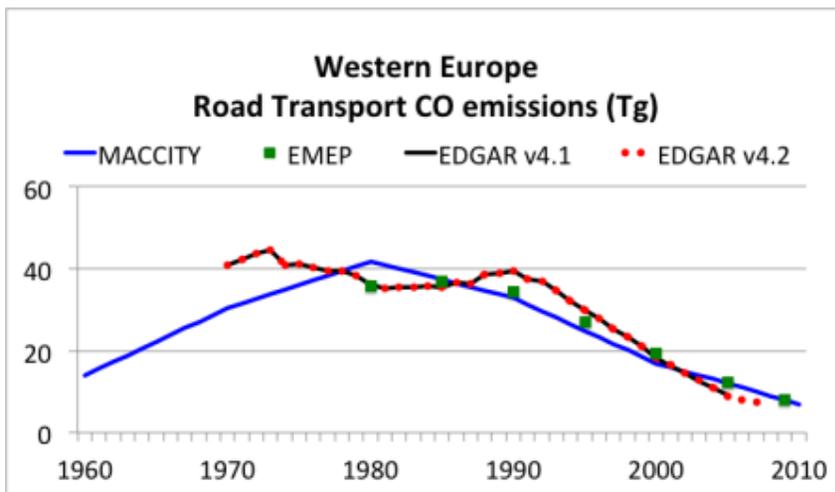

Other countries use different sectors split

Other issue:

→ Global inventories: provide BC and OC

→ Regional/regulatory inventories: provide only PMs

# Road transport CO emissions for different regions

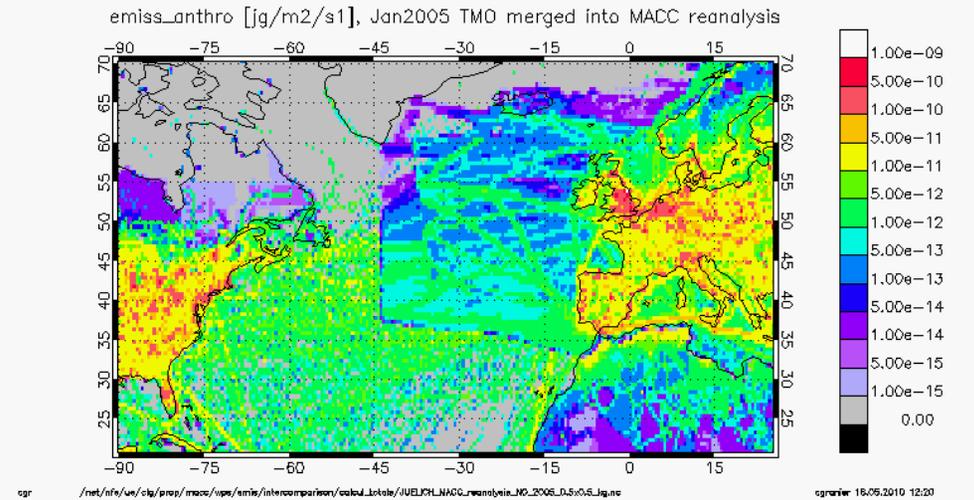

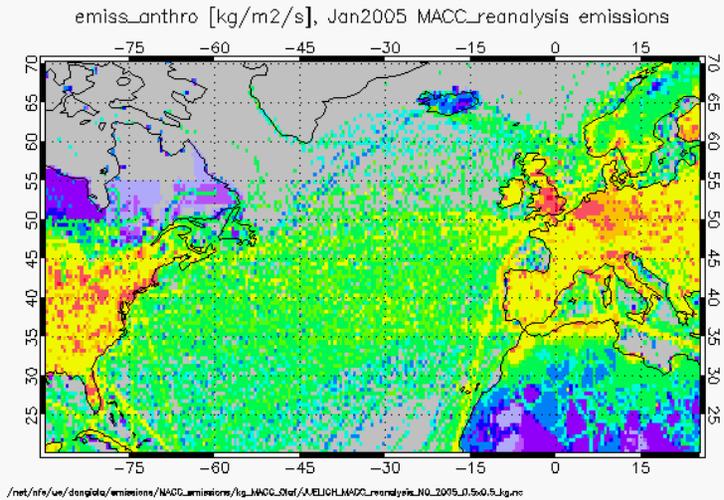

## Another sector of growing importance: Maritime transport

Top 5 emitters of main air pollutants in 2005

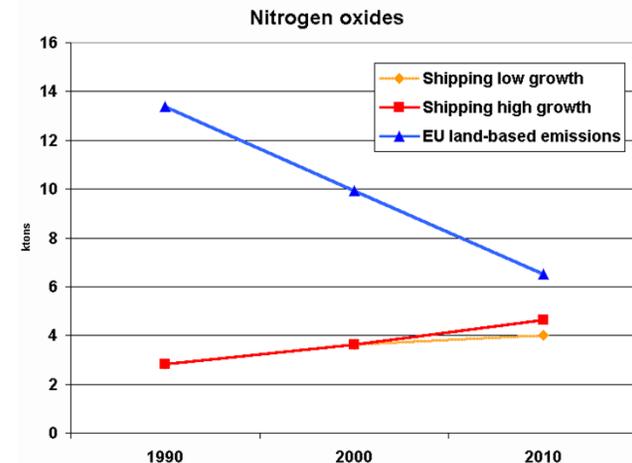

2005	Tg CO	2005	Tg NMVOC	2005	Tg NO <sub>2</sub>	2005	Tg SO <sub>2</sub>
China	103.20	China	17.22	China	22.45	China	36.36
Brazil	96.42	USA	11.56	USA	14.92	USA	10.81
USA	61.52	Brazil	10.47	Int. shipping	12.98	Int. shipping	7.87
India	52.77	Russia	8.39	India	8.19	India	7.41
Indonesia	49.65	Indonesia	8.22	Russia	4.30	Russia	6.71

# Ship emissions: large discrepancies between global and regional emissions

→ Will be addressed in MACC-II in collaboration with the ACCESS European project (management of the Arctic)

**Changes in NO<sub>x</sub> emissions in Europe 1990-2010: ships will be the largest contributor to NO<sub>x</sub> emissions by ~2015-2020**

## 4. What about anthropogenic VOCs

VOCs emissions reported only as total NMVOCs

Not much information on VOCs speciation

Many studies: VOCs speciation based on the RETRO emissions inventory (<http://retro.enes.org>), based on a speciation developed by TNO in the 1990s

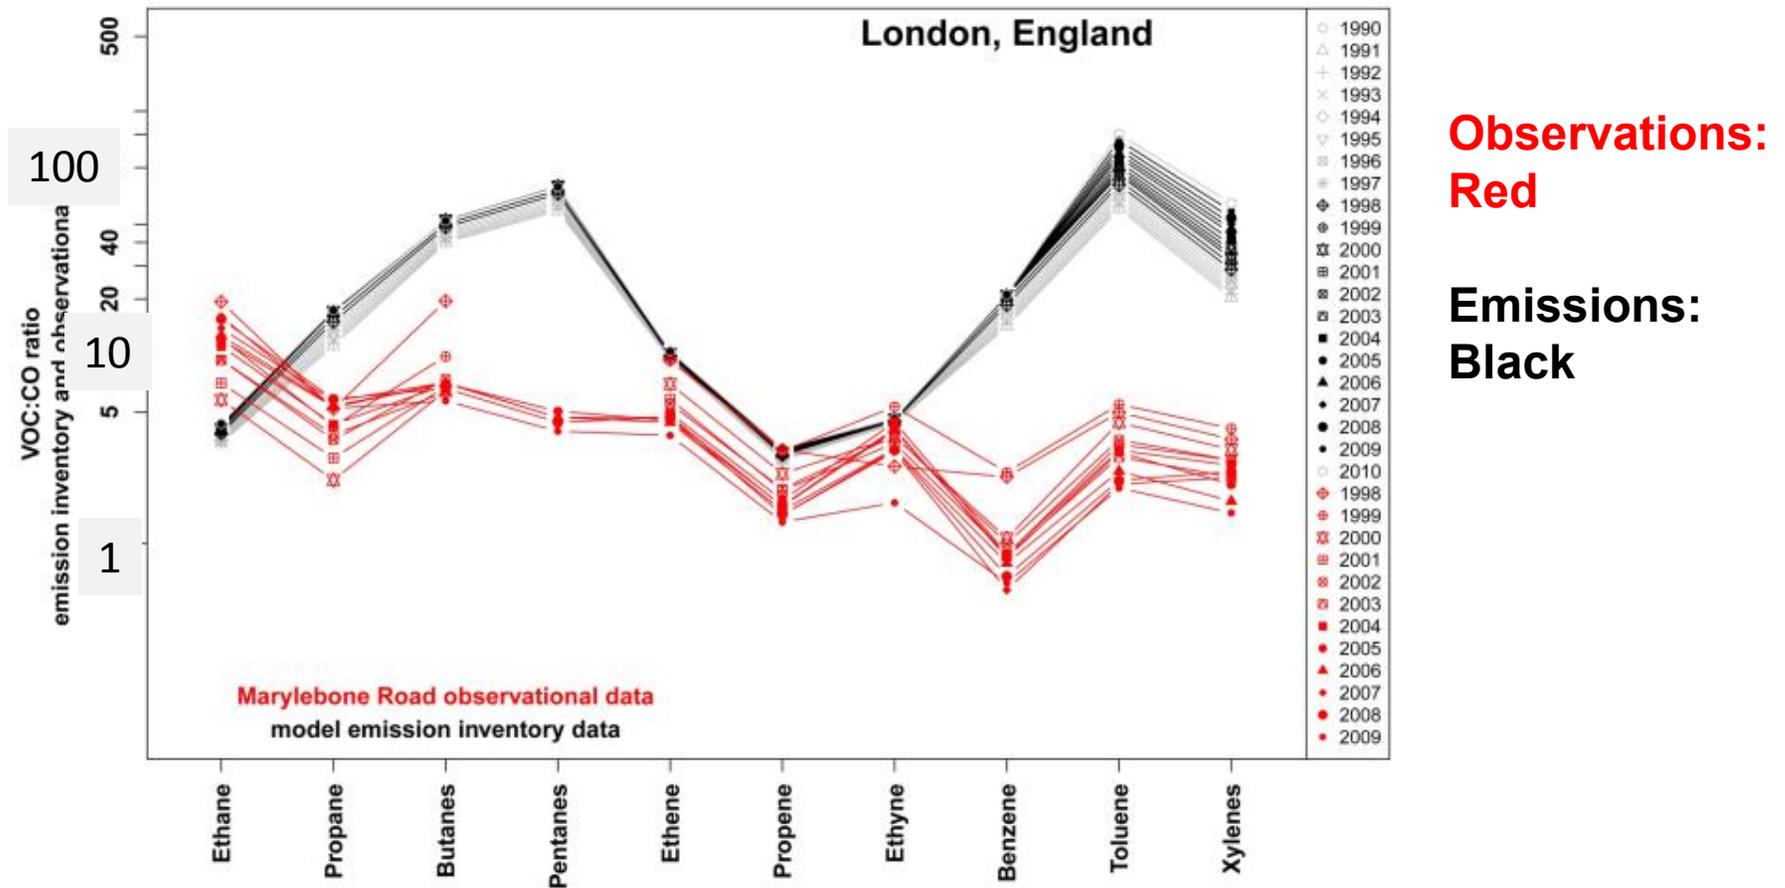

Methodology:

$$[\text{Emission VOC}_x] = [\text{Total VOCs emissions}] * R (\text{lat,lon})$$

- ✓ No recent data available
- ✓ R remains CONSTANT for ALL years

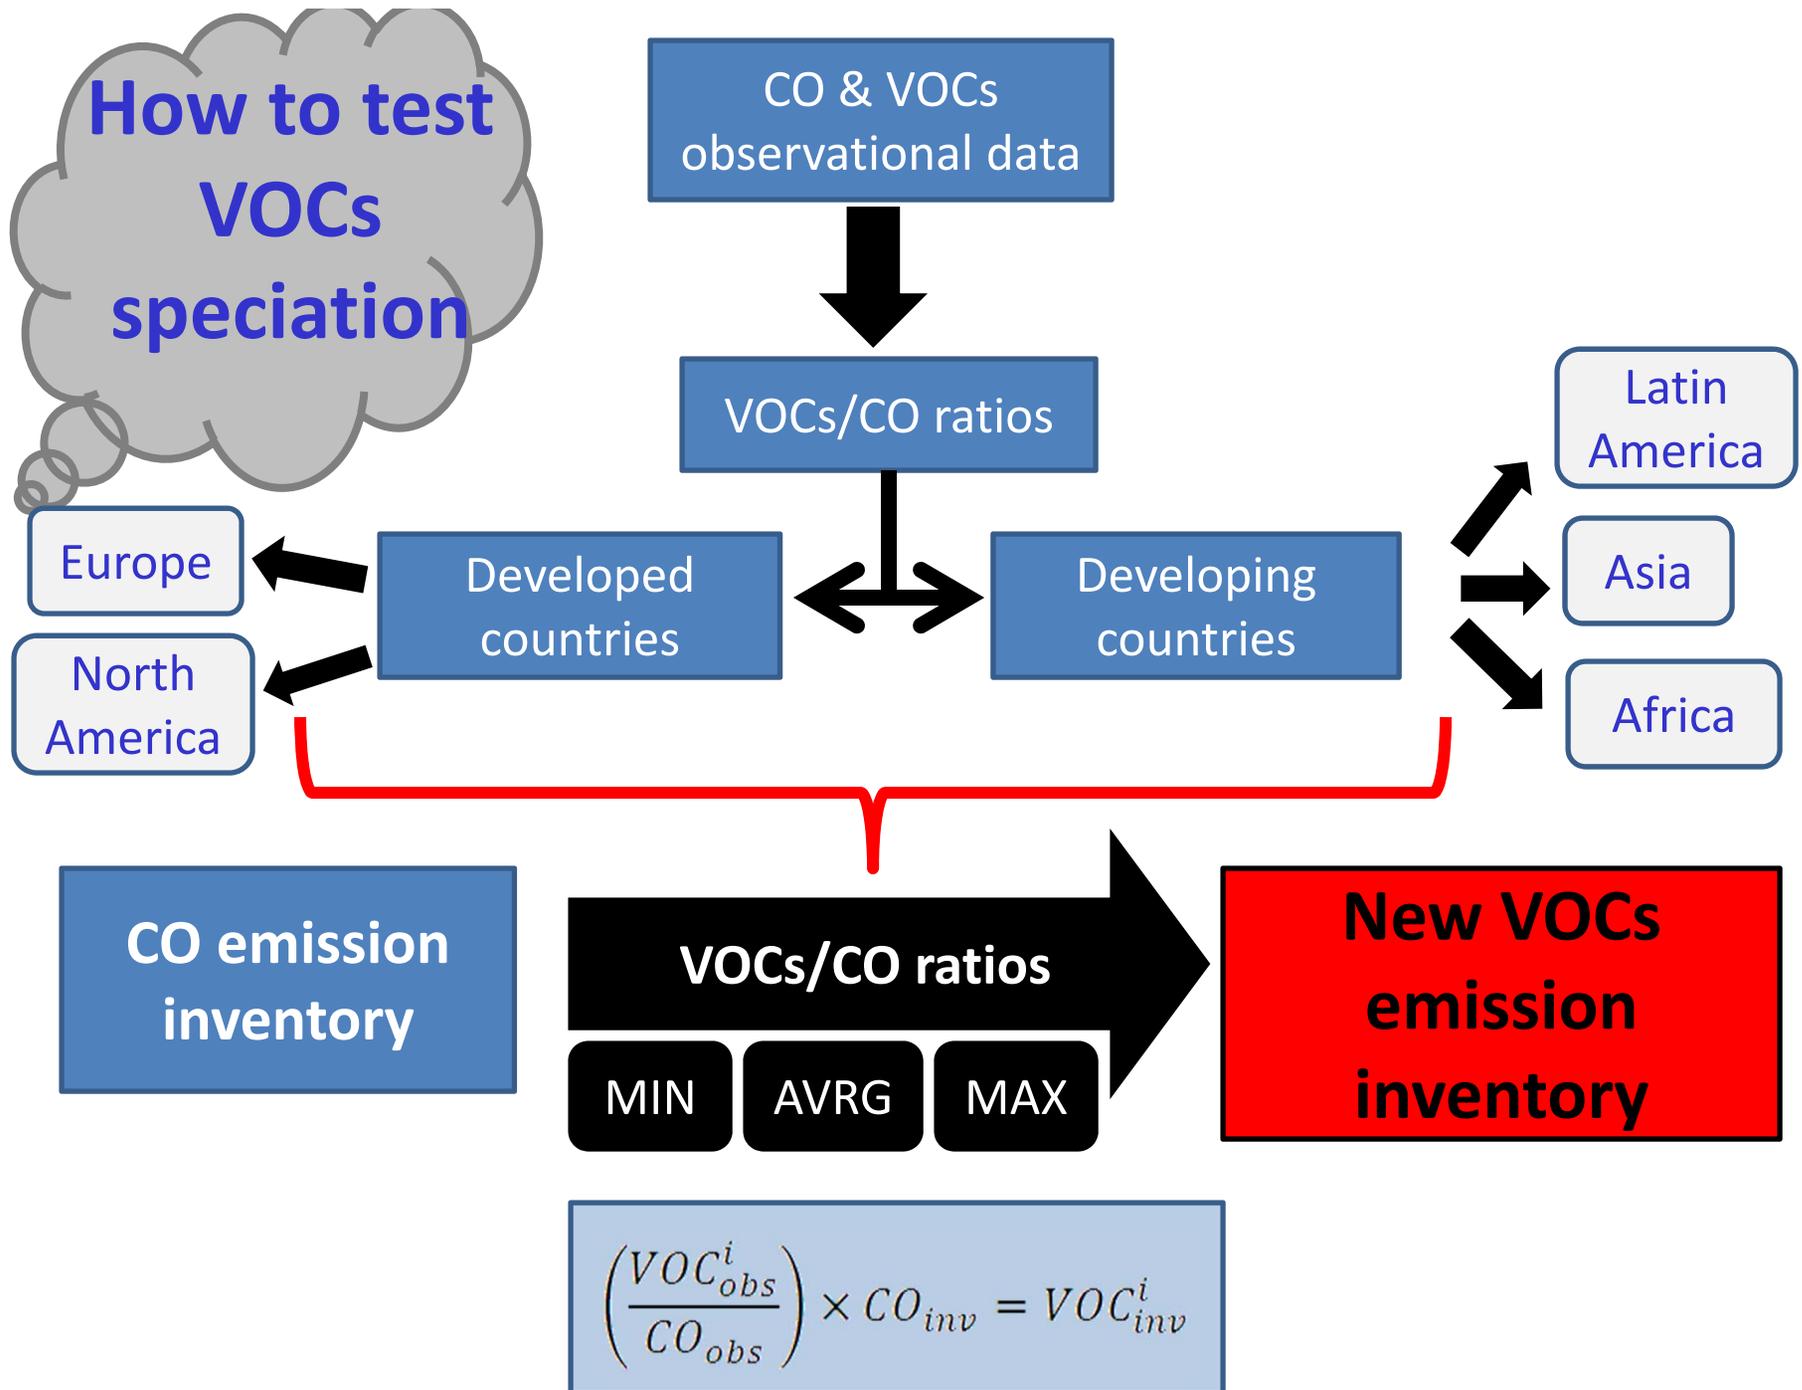

## Ongoing study: collaboration with U. Leicester, UK

- Collect individual VOCs data when available (not many!)
- Von Schneidemesser et al. (Atm. Env., 2010)
- Compare VOCs/CO ratio: observed concentrations and emissions

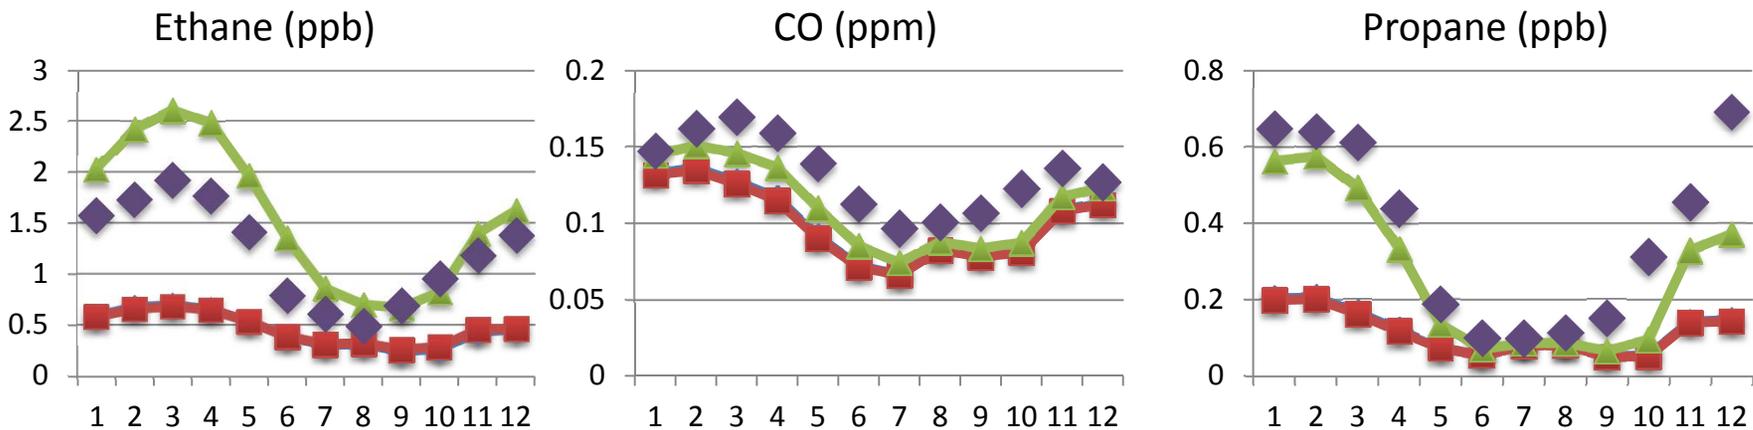

LONDON (Marylebone Road)

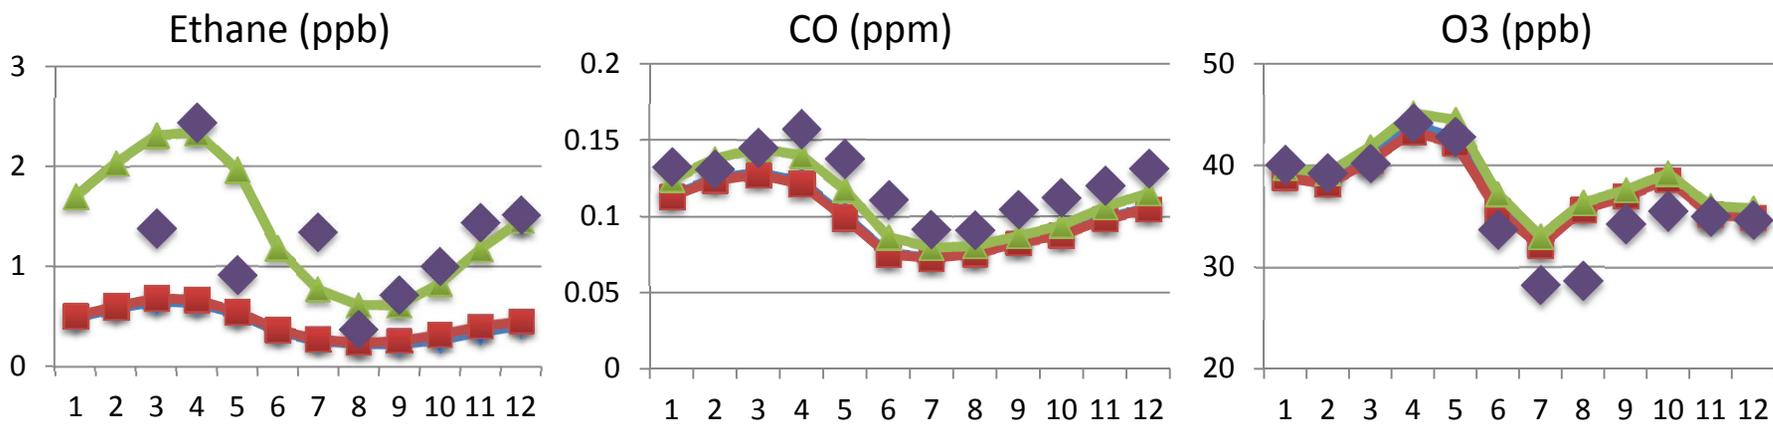

## b) Observational stations (year 2005)

### i) Trinidad Head (USA)

### ii) Mace Head (Ireland)

■ STD   
 ■ AVRG   
 ■ MAX   
 ■ Observations

1. Do we have consistent historical emissions?
  2. Can we trust current datasets/can we recommend a “best” dataset?
  3. Can we compare emissions by sectors?
  4. What about anthropogenic VOCs?
- + Where can you find many of the datasets used here**
