Updates

- Modeling Overview
- ICAP-MME: More at end of the meeting
- Satellite Data Assessment

Navy Aerosol Modeling Spanning Global to Mesoscale

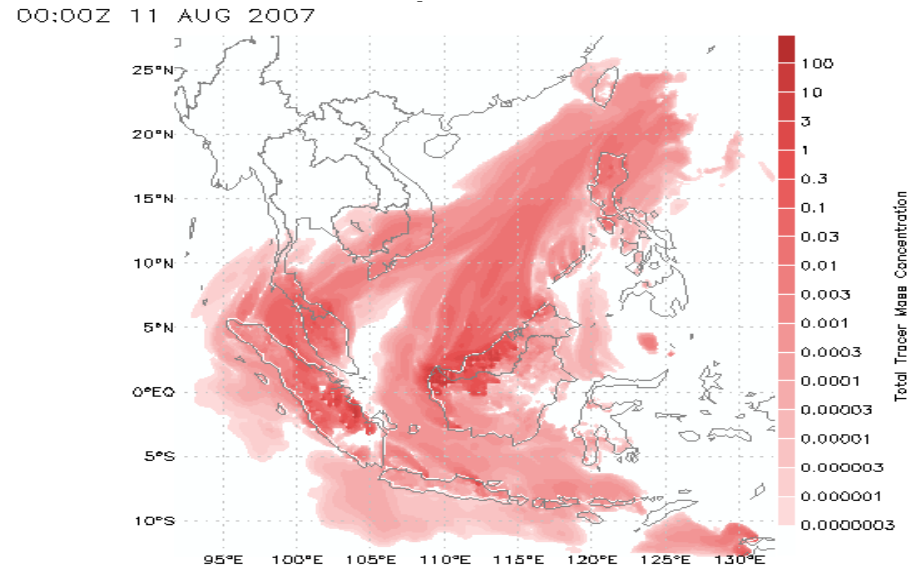

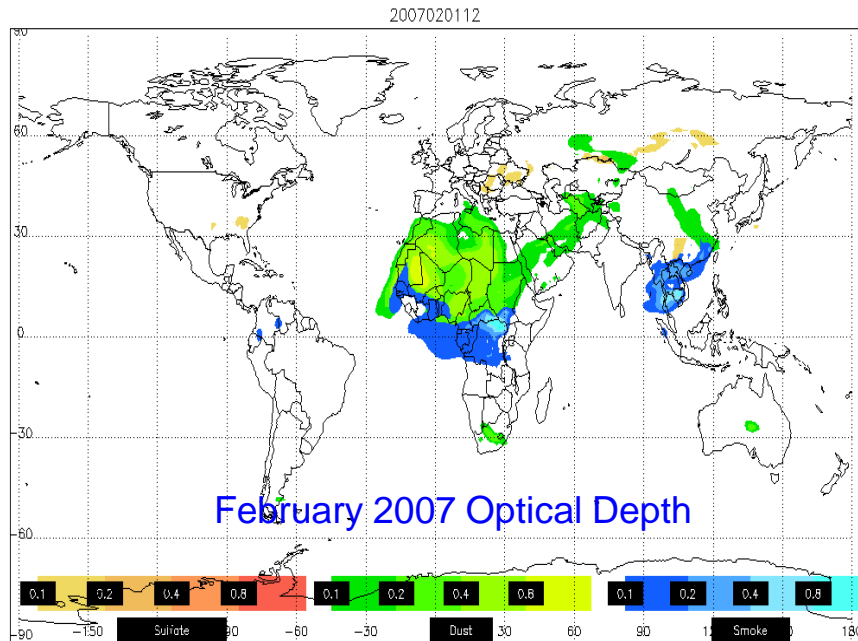

<http://www.nrlmry.navy.mil/aerosol/>

Global Modeling: Navy Aerosol Analysis and Prediction System (NAAPS)

- Navy's operational global aerosol model; now at 1/3 degree resolution using NAVGEM meteorology.
- 6-day forecasts of dust, smoke, pollution, and sea salt run 4x/day
- Assimilates quasi-operational MODIS aerosol & geostationary fire data streams.

Mesoscale Modeling: Coupled Ocean Atmosphere Mesoscale Prediction System (COAMPS®)

- COAMPS® is a mesoscale atmospheric model fully coupled with the ocean.
- Dust forecasts are operational at FNMOC and additional aerosol species fully coupled with the model are being added by NRL.
- COAMPS® can be used to study complicated coastal flows where aerosol particles, winds, and water vapor covary.

Operational Satellite Data Inputs to NAAAPS

- **Aerosol Optical Depth**

- Worked closely w/ NASA developers to characterize and reduce errors in satellite aerosol products.
- Retrieved AOD products corrected and aggregated before assimilation
- Terra and Aqua MODIS used operationally
- Research evaluating VIIRS, MISR, AVHRR products

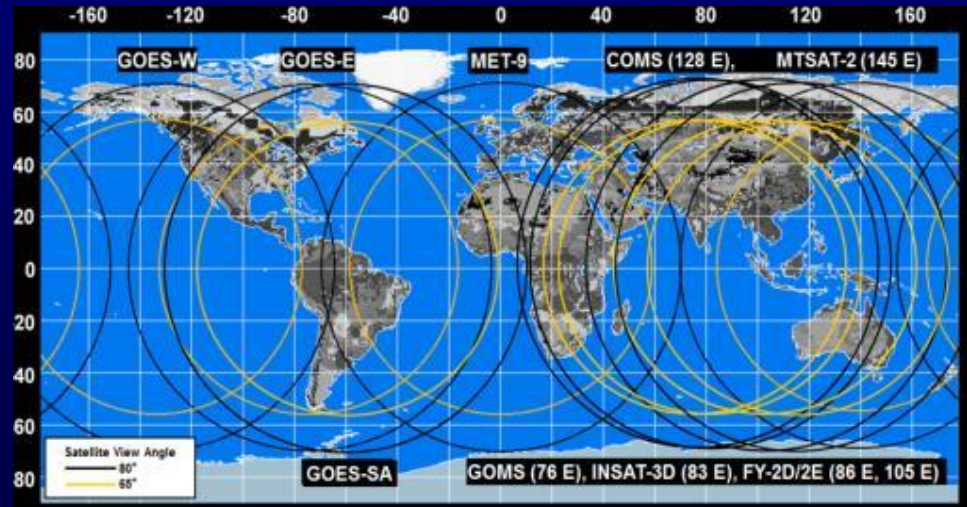

- **Aerosol vertical profiles**

- Experimental 2D/3DVAR system to assimilate CALIOP backscatter data (Zhang et al. GRL 2011)

Geostationary constellation for fire detection. Currently launched geostationary satellites have the potential for global fire monitoring between 40S-40N latitude, but fire products are not yet available from all sensors.

- **Satellite fire observations**

- Products based on thermal anomalies
- Terra and Aqua MODIS, GOES-EAST, and GOES-WEST used operationally
- Currently evaluating global geostationary observations
 - METEOSAT, MTSAT, COMS

What's in a model? Pick your flavor

NAAPS Global Model

- FNMOC Operational: Now 1/3 degree running off of NAVGEM.
- eNAAPS: Quasi-operational still at 1 degree and on 20 member NOGAP ensemble.
- 10 Year Reanalysis: Our best available 1 degree model with everything but the kitchen sink data assimilation. 2003-2012. Now with SOA!
- Impact studies: Multiple configurations running at any one time.

COAMPS Mesoscale Model

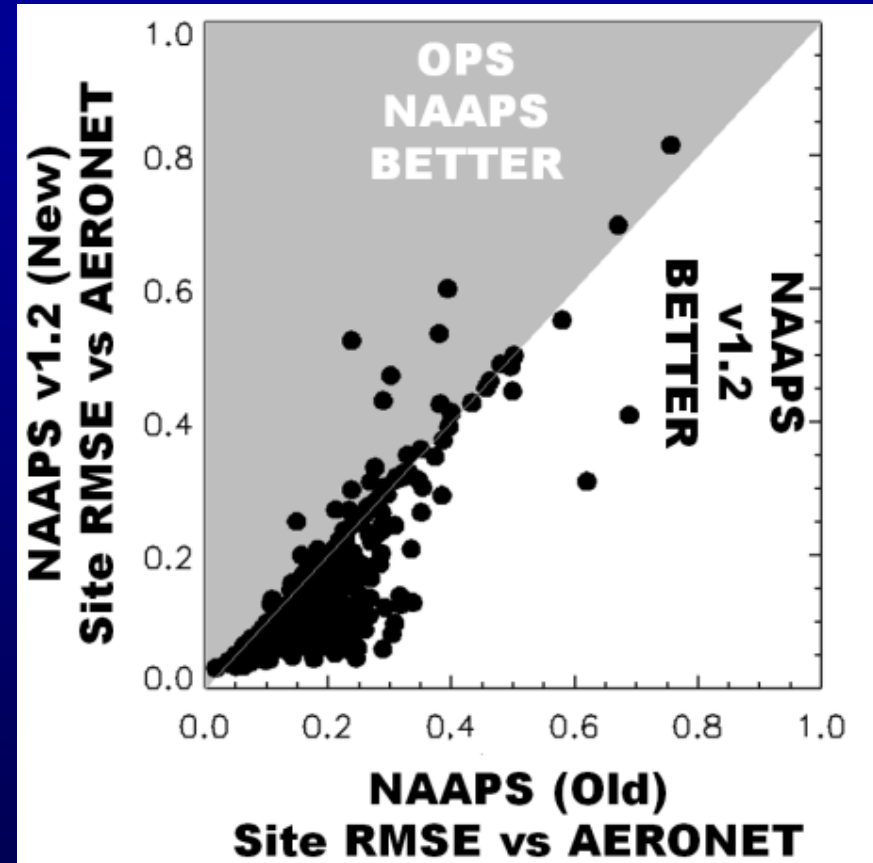

- Inline COAMPS dust components operational at FNMOC since 2001
- Current development is to port all NAAPS species into COAMPS.
- COAMPS will have 'infinite scalars' capability to allow flexible microphysics
- Any aerosol characteristic can be advected.
- Has ensemble versions of dust components ported to DART

Components of NAAPS and recent operational upgrade to 1/3 degree in NAVGEM

- NAAPS: Recent transition to NAVGEM
 - Upgraded from 1° to 1/3° resolution to run using NAVGEM. Errors down by 30%
 - Same species: Dust, smoke, sea salt, sulfate
 - Semi-Lagrangian transport scheme modified so each species can have its own complete microphysics
- NAVDAS-AOD: AOD assimilation for NAAPS
 - 2d Var scheme upgraded to use NAVGEM
 - MODIS AOD pre-processor upgraded to assimilate higher resolution obs
- FLAMBE: Smoke source model for NAAPS
 - Latency improved from 12-36 hours after overpass to 3-6 hours
 - Separate processing for each sensor

Model evaluation vs. AERONET in situ AOD data. The new NAAPS is clearly more accurate with a lower RMSE in 280 of 341 (82%) of the sites with 100+ AERONET AOD observations, and 141 of 154 (92%) sites where mean NAAPS AOD differed by 0.1 or more between the two systems.

SOA in Reanalysis Slated for Transition: Approach

- Put VOC (MACC) / Primary Organic Aerosol (Bond) emissions inventories in model
- Updated S emissions inventory
- Carry the SOA, POA, etc in the model in the SO₄ field (i.e., “SO₄” = POA+SO₄ + etc.)
- Deal with SOA as an effective yield X VOC (i.e., effective instantaneous oxidation) using VBS 4 approach with 4 VOC “classes”: aromatics, monoterpenes, alkenes, and isoprene
- Note that all of this is PRE-PROCESSING

Comparison of model performance with a much more elaborate (chemistry) model

- NAAPS: $R^2=0.52$,
- bias = 0.051, slope=0.63
- PNNL-MMF: $R^2=0.55$,
- bias= -0.13, slope ~ 0.66

ICAP- Multi Model Ensemble

The Unglamorous Engineering Side: Gathering all of the world's forecast data

- ICAP-MME warehousing all the world's global aerosol forecast data to feed the ICAP multi-model ensemble. Hope UKMO will be coming soon.
- While July 2011-Dec 2012 is our focus, we are still collecting data.
- Thanks to Hogan and McLay we have a much more contiguous NOGAPS ensemble.
- NASA also has rerun for the MME

Current ICAPS Forecast Availability at NRL-MRY

ICAP Multi-model ensemble: How do models compare on average?

ICAP MMD Jun-Dec 2012 6 hr Statistics

Total AOT

Dust AOT

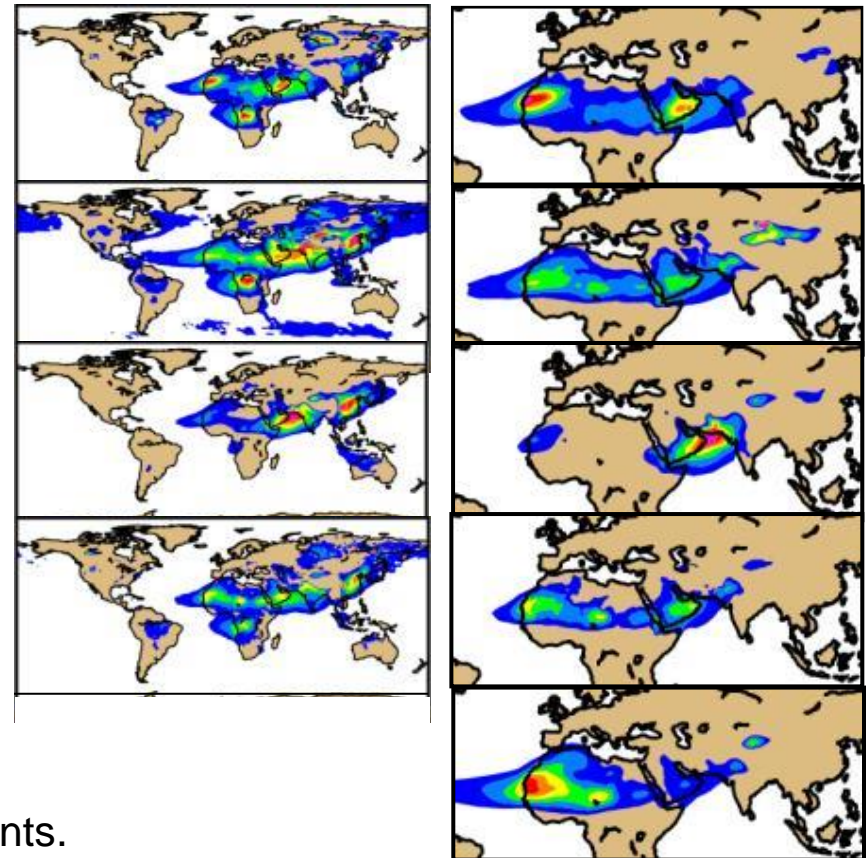

Aerosol Optical Thickness (550 nm)

0 0.03 0.06 0.09

Average AOT Standard Deviation (550 nm)

Individual Models Total AOT Dust AOT

- Often large differences between individual events.
- Most models underestimate dust/smoke and overestimate sea salt AOT.
- Large differences between species in heterogeneous environments.
- Tendencies to tune the climatological averages and the MME mean.

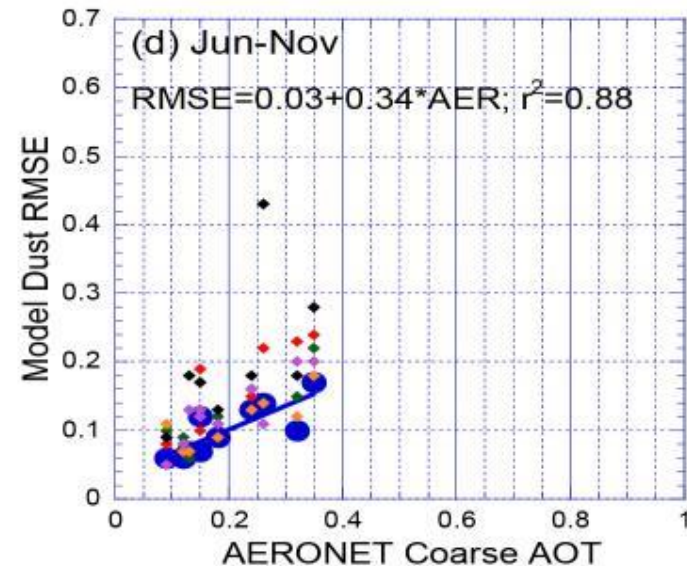

Well, So what about the ensemble?
For RMSE, FGE, etc, ICAP-MME is top performer

Divergence in models tells us when and where to look at satellite imagery

11/27 Dust enhancement

Satellite Data Evaluation

(what we spend most of our time on)

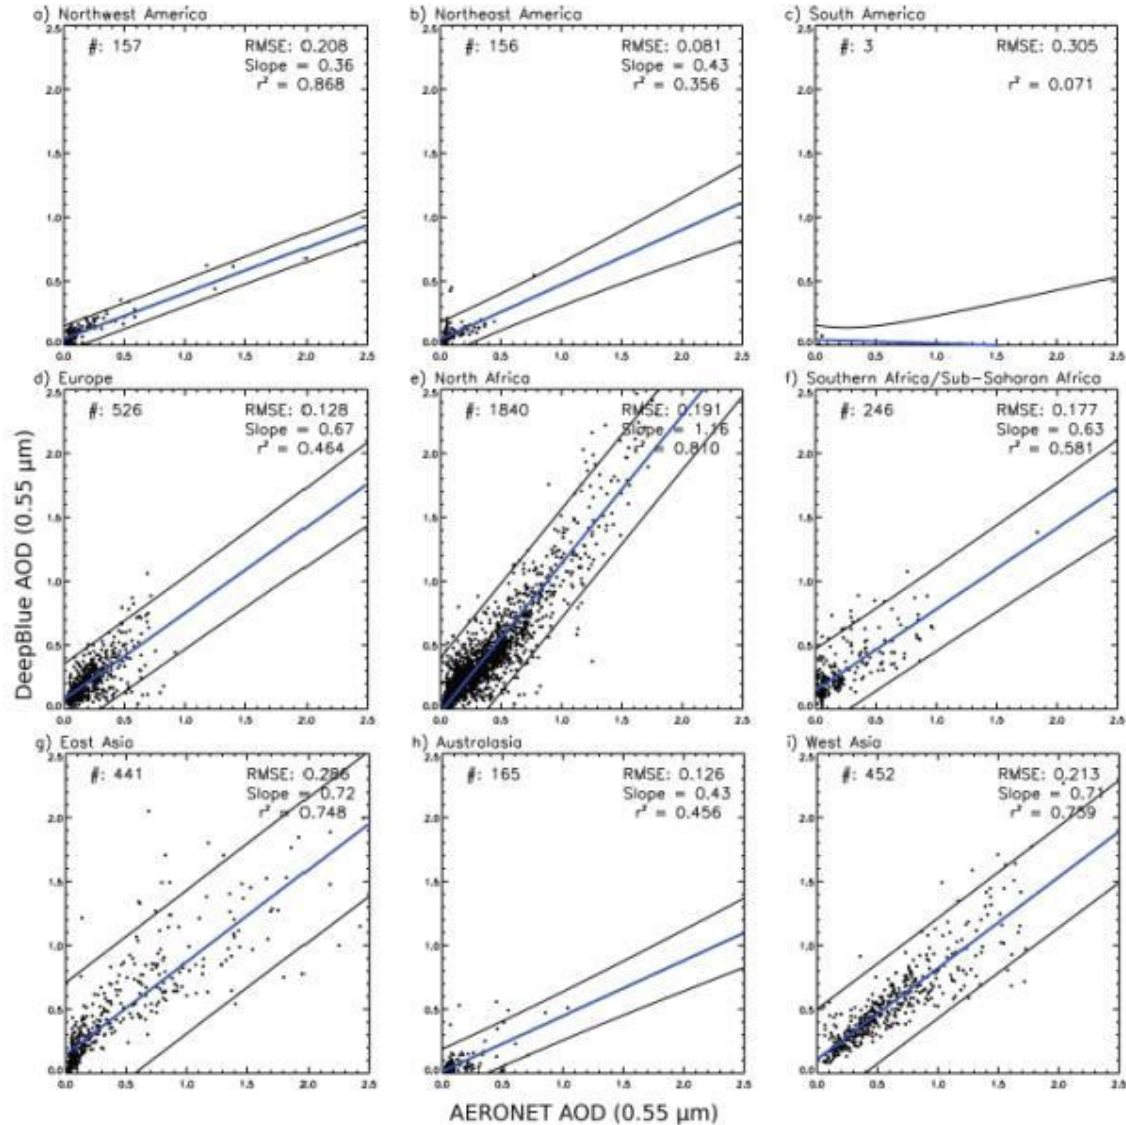

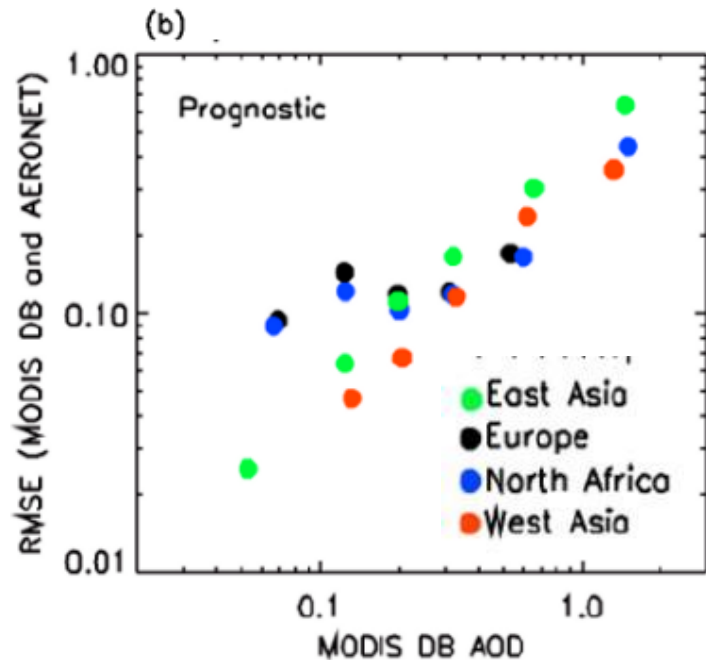

Independent validation of Deep Blue 5.1

Shi et al., 2013

- Bottom line: Good correlations but strong regional biases.
- Be careful about data quality flags!

MISR Cloud Clearing-Needed to fuse MODIS+MISR (Shi et al., 2013-submitted)

Cloud issues

Solution:

Use MODIS cloud mask on MISR as an additional filter

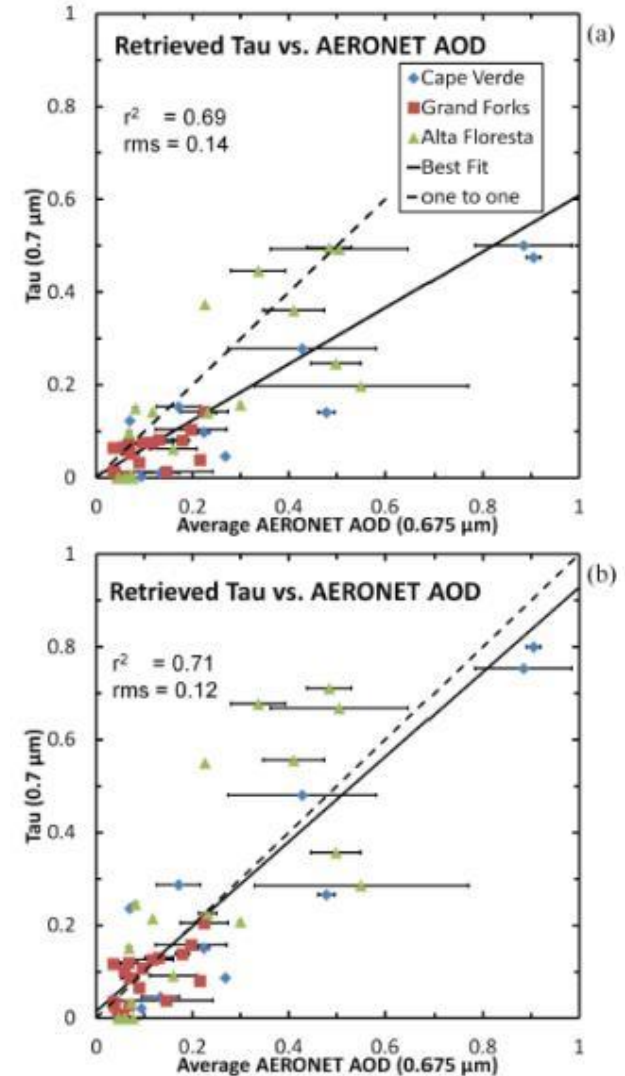

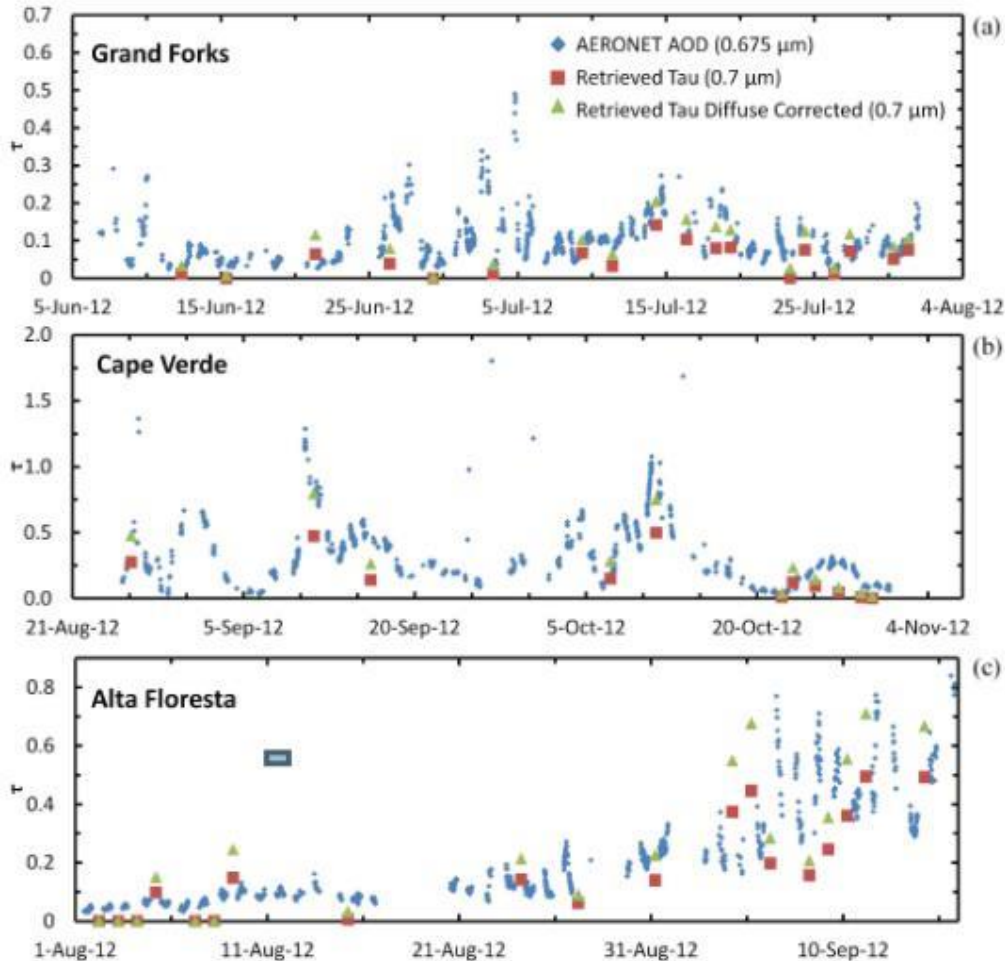

MISR AOD (0.558 μm)

VIIRS Nighttime AOT (Johnson et al., 2013)

Use city light brightness to estimate AOT

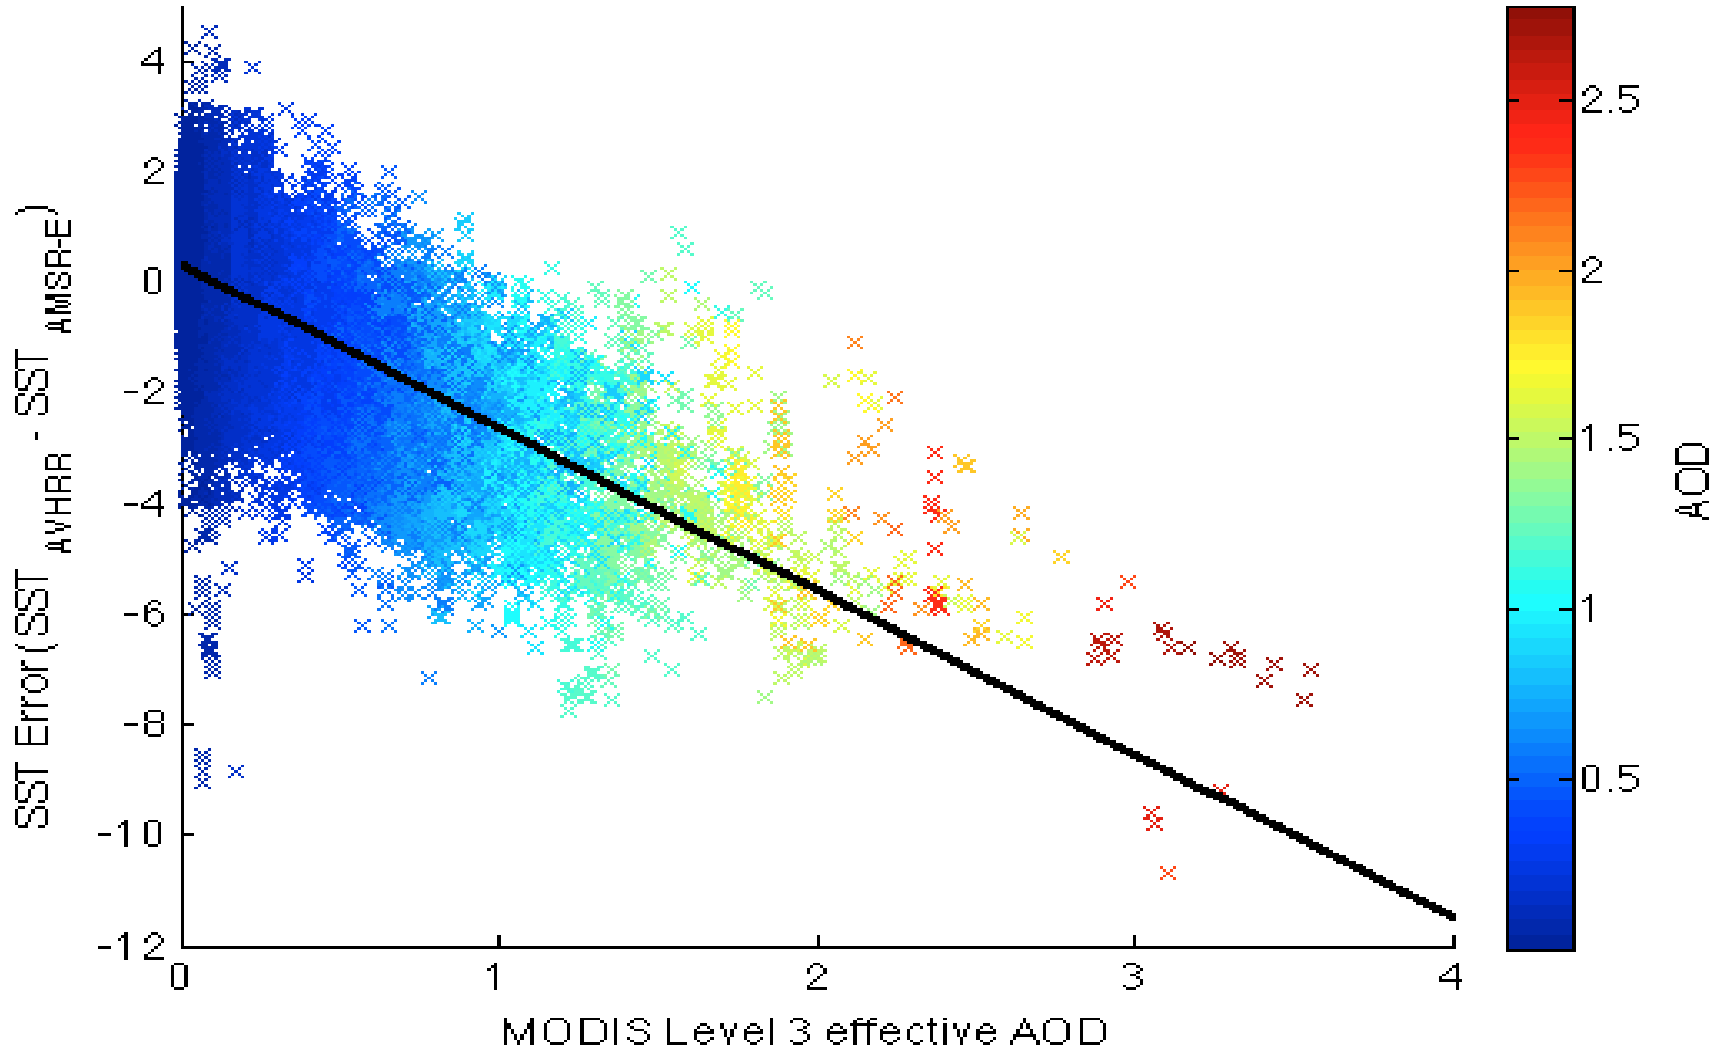

SST Impacts

(Bogdanoff, submitted)

SST Error vs. Effective AOD, Possible Contamination

Potting it all together: Can we really monitor a region by AOT. Sometimes... (Reid et al., 2013)

- Satellite data quality?
Depends on what you want to do with it.
- Good news is that this community is shining a light on data quantification.
- Every product has its place, but whole trust is not warranted at this time.
- GEWEX aerosol report will reflect our concerns.
- Looking forward to Col 6.

Conclusion

Our plans for the year ahead

- Implemented 0.33 degree NAAPS operationally at FNMOC 25Sept 2013. Next, push SOA to ops.
- COAMPS aerosol to mimic NAAPS
- Start FLAMBE2 quasi-operationally.
- No rush on VIIRS DA product
- More modeling focus on COAMPS, particularly with the SEAC4RS field work.
- Preparation for CATS lidar data.
- Advancing development of EnKF aerosol DA to run quasi-operationally.
- UND: Forward models for radiance assimilation.
- Playing with the ICAP multi-model ensemble!
